Ganglion Cell Anatomy

- Analysis of VF in RGC loss in Glaucoma
  - 24-2 protocol has 6 degrees separation allowing for thinning the RGC to be missed to due point placement
    - Drazdo t al: Vision Research 2007
  - 10-2 testing substantially improves correlation with RGC analysis
    - Hood and Raza; Vis Science 2011
  - Stamper(1984) identified the relationship between NTG and macular damage with typically near fixation visual field loss.
  - Heijl & Lundqvist 1984
    - 45 patients followed from normal to abnormal VF's using test points at 5,10,15 & 20 degrees from fixation
    - Largest number at 15 degrees but a surprising number at 5 degrees confirming Hood's work showing that early damage occurs in the macula as well as more traditional arcuate zones

Macular Vulnerability Zone

Prog Retin Eye Res. 2013 January ; 32C: 1–21. doi:10.1016/j.preteyeres.2012.08.003.

Progression in Glaucoma

- Very complicated to look at progression of glaucoma as a topic itself
- Must confirm if glaucoma is truly progressing
- Many factors have contributed to higher rates of progression
  - CH at baseline
  - CCT at basline
  - Family History
  - Magnitude of IOP lowering
  - Treatment vs. no treatment
  - Macular ganglion cell layer thickness at baseline
  - IOP at baseline
  - Extent of presenting disease burden

Optical Coherence Tomography as a Biomarker for Diagnosis, Progression, and Prognosis of Neurodegenerative Diseases
Satue, etal AJO 2016

- Recent research using the latest SD OCT imaging technology has demonstrated that an early damage of the anterior visual pathway occurs in MS, PD, and AD and that the ganglion cell layer is the ultimate biomarker for disease diagnosis, severity, and progression.
- Thus, OCT technology should be used as a common and very useful clinical complement in the diagnosis and control of neurodegenerative disorders.

American Journal of Ophthalmology
December 2017

Baseline Fourier-Domain Optical Coherence Tomography Structural Risk Factors for Visual Field Progression in the Advanced Imaging for Glaucoma Study

David Huang, MD etal

AIG/ 2017

- A total of 277 eyes of 188 participants were followed up for 3.7 ± 2.1 years.
- VF progression was observed in 83 eyes (30%).
- Several baseline NFL and GCC parameters, but not disc parameters, were found to be significant predictors of progression on univariate Cox regression analysis.
- The most accurate single predictors were the GCC focal loss volume (FLV), followed closely by NFL-FLV. An abnormal GCC-FLV at baseline increased risk of progression by a hazard ratio of 3.1

New Perspectives on Disease Management

- SD-OCT is superior in identifying progression in glaucoma suspects, pre-perimetric glaucoma, mild glaucoma and early moderate disease compared with SAP are superior in identifying progression, after an initial VF to set baseline.
- Average time to identification of statistically significant progression is 2-3 years with SD-OCT and up 6 years with SAP
- Intra-test variability is up to 10x less with OCT(3%) than VF(20%)

New Perspectives on Disease Management

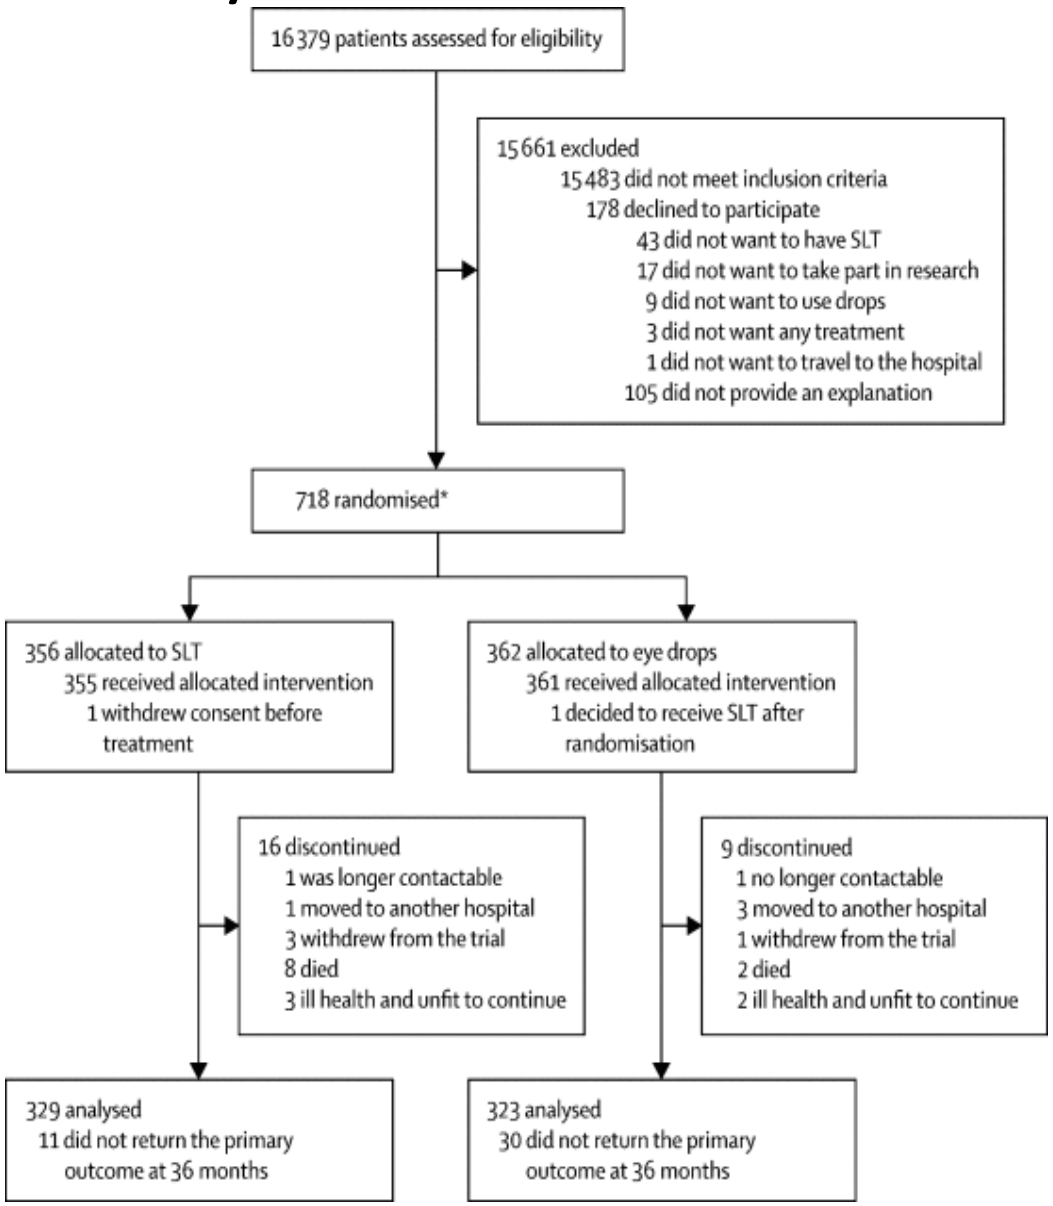
- RNFL “Floor” limits usefulness in late moderate to advanced glaucoma (50-60 microns)
- GCC progression analysis can continue to be useful in late moderate to advanced glaucoma due to density of fibers in the macula and the later involvement of central vision in the disease

THE LANCET
THE “LIGHT” STUDY

VOLUME 393, ISSUE 10180, P1505-1516, APRIL 13, 2019

- **Selective laser trabeculoplasty versus eye drops for first-line treatment of ocular hypertension and glaucoma (LiGHT): a multicentre randomised controlled trial**
- Gus Gazzard, FRCOphth
- Evgenia Konstantakopoulou, PhD
- Prof David Garway-Heath, MD
- Anurag Garg, FRCOphth
- Victoria Vickerstaff, MSc
- Rachael Hunter, MSc
- et al.

The LIGHT Study



LIGHT Study

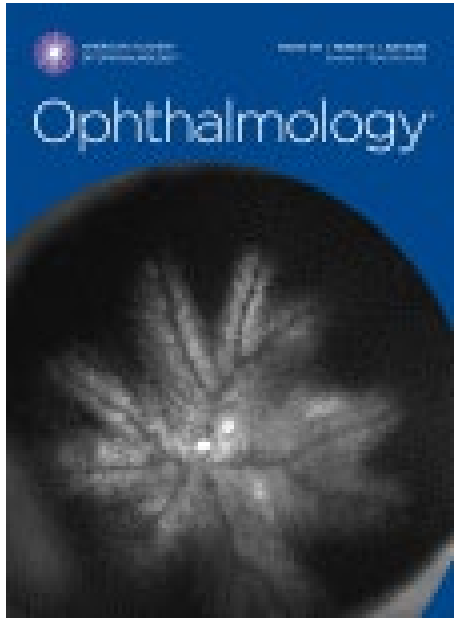
- Standardization of laser delivery was achieved by protocol-defined settings and clinical endpoints.[14]
- Selective laser trabeculoplasty was delivered to 360° of the trabecular meshwork. 100 non-overlapping shots (25 per quadrant) were used, with the laser energy varied from 0·3 to 1·4 mJ by the clinician, using an appropriate laser gonioscopy lens.
- One re-treatment with selective laser trabeculoplasty was allowed, provided there had been a reduction in intraocular pressure after the initial treatment; the next escalation was medical therapy.
- Significant complications of selective laser trabeculoplasty (eg, a spike in intraocular pressure) precluded repetition of selective laser trabeculoplasty.

LIGHT Study

- Drug classes for first, second, or third line treatment were defined by NICE[15] and European Glaucoma Society[19] guidance
- First line was prostaglandin analogues, second line was β blockers, third or fourth line was topical carbonic anhydrase inhibitors or α agonists. Fixed combination drops were allowed.
- Systemic carbonic anhydrase inhibitors were only permitted while awaiting surgery. Maximum tolerated medical therapy was defined by the treating clinician as the most intensive combination of drops an individual could reasonably, reliably, and safely use and thus varied between patients.
- A need for treatment escalation beyond maximum tolerated medical therapy triggered an offer of surgery.

The Light study

- **Findings**
- **Of 718 patients enrolled, 356 were randomised to the selective laser trabeculoplasty and 362 to the eye drops group. 652 (91%) returned the primary outcome questionnaire at 36 months.**
- **Average EQ-5D score was 0·89 (SD 0·18) in the selective laser trabeculoplasty group versus 0·90 (SD 0·16) in the eye drops group, with no significant difference (difference 0·01, 95% CI –0·01 to 0·03; p=0·23).**
- **At 36 months, 74·2% (95% CI 69·3–78·6) of patients in the selective laser trabeculoplasty group required no drops to maintain intraocular pressure at target.**
- **Eyes of patients in the selective laser trabeculoplasty group were within target intracoluar pressure at more visits (93·0%) than in the eye drops group (91·3%), with glaucoma surgery to lower intraocular pressure required in none versus 11 patients.**
- **Over 36 months, from an ophthalmology cost perspective, there was a 97% probability of selective laser trabeculoplasty as first treatment being more cost-effective than eye drops first at a willingness to pay of £20 000 per quality-adjusted life-year gained.**



Efficacy of Repeat Selective Laser Trabeculoplasty in Medication-Naive Open-Angle Glaucoma and Ocular Hypertension during the LiGHT Trial

AnuragGargFRCOphth;[1] VictoriaVickerstaffMSc[2,3] NeilNathwaniBSc[1] DavidGarway-HeathMD[1] EvgeniaKonstantakopoulouPhD[1] GarethAmblerPhD[4] CateyBunceDSc[1,5,6] RichardWormaldFRCOphth[1,6] KeithBartonFRCS[1] GusGazzardMD[1] Laser

Repeat SLT

- Results
- A total of 115 eyes of 90 patients received repeat SLT during the first 18 months of the trial. Pretreatment IOP before initial SLT was significantly higher than before retreatment IOP of repeat SLT (mean difference, 3.4 mmHg; 95% confidence interval [CI], 2.6–4.3 mmHg; $P < 0.001$).
- Absolute IOP reduction at 2 months was greater after initial SLT compared with repeat SLT (mean difference, 1.0 mmHg; 95% CI, 0.2–1.8 mmHg; $P = 0.02$).
- Adjusted absolute IOP reduction at 2 months (adjusting for IOP before initial or repeat laser) was greater after repeat SLT (adjusted mean difference, −1.1 mmHg, 95% CI, −1.7 to −0.5 mmHg; $P = 0.001$).
- A total of 34 eyes were early failures (retreatment 2 months after initial SLT) versus 81 later failures (retreatment >2 months after initial SLT). No significant difference in early absolute IOP reduction at 2 months after repeat SLT was noted between early and later failures (mean difference, 0.3 mmHg; 95% CI, −1.1 to 1.8 mmHg; $P = 0.655$).
- Repeat SLT maintained drop-free IOP control in 67% of 115 eyes at 18 months, with no clinically relevant adverse events.

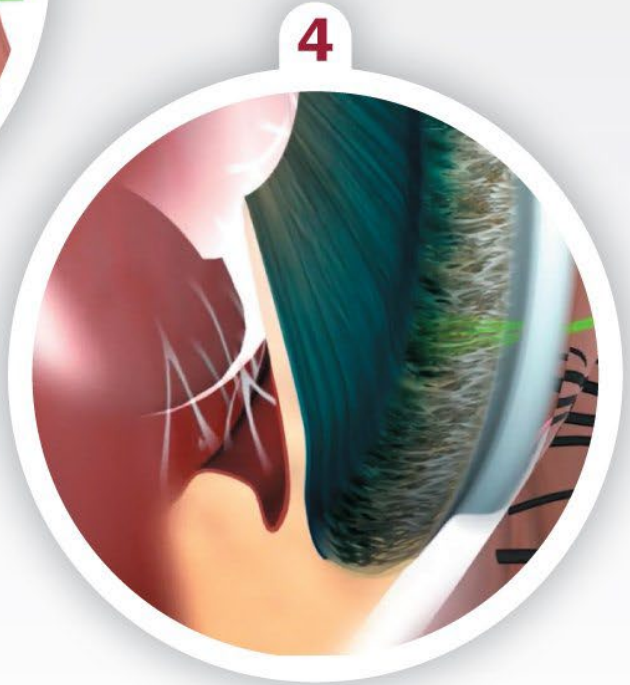
4



IN VIEW: The investigational non-invasive, non-contact procedure is performed with automated laser technology that delivers 100 spots to the trabecular meshwork through the limbus in just 1.2 seconds. *(Images courtesy of BELKIN Laser Ltd.)*

WATCH THE PROCEDURE Go to OphthalmologyTimes.com/1Second

Belkin DSLT

- An investigational IOP-lowering modality, direct selective laser trabeculoplasty (DSLT) (BELKIN Laser), is being developed for its potential as a first-line treatment for ocular hypertension (OHT) open-angle glaucoma (OAG) and possibly for angle-closure glaucoma (ACG) that overcomes the limitations of current initial therapeutic options.
- The non-invasive, non-contact procedure is performed with automated laser technology that delivers 100 spots to the trabecular meshwork through the limbus in just 1.2 seconds.
- A proof-of-concept study provided evidence for the efficacy and safety of the transscleral approach to laser beam delivery using a conventional SLT instrument, and studies are under way outside of the United States using the external automatic glaucoma laser device itself

Belkin DSLT

- **Results**: In the trial group (N=16), IOP decrease from an average of 20.21 mmHg before treatment to 15.50 at 6 months.
- The corresponding numbers for the control group (n=16), were 21.14 mmHg and 15.00. There was no statistical difference between the two groups in IOP reduction.
- Complications rate was significantly higher in the control group ($p<0.0001$, OR 6.881, 95% CI 1.676/28.248).
- Anterior chamber inflammation and superficial punctate keratitis rates were significantly higher in the control group and compared to the study group ($p=0.006$).

OPHTHALMOLOGY VOLUME 127, ISSUE 4

Measuring Glaucomatous Focal Perfusion Loss in the Peripapillary Retina Using OCT Angiography

David Huang, MD et al

.

Participants

A total of 47 patients with primary open-angle glaucoma (POAG) and 36 normal participants were analyzed.

Methods

One eye of each subject was scanned using an AngioVue (Optovue, Fremont, CA) 4.5-mm OCTA scan centered on the disc.

En face nerve fiber layer (NFL) plexus angiogram was generated. With the use of custom software, a capillary density map was obtained by computing the fraction of area occupied by flow pixels after low-pass filtering by local averaging 21×21 pixels.

The low-perfusion map is defined by local capillary density below 0.5 percentile over a contiguous area above 98.5 percentile of the normal reference population. The LPA parameter is the cumulative area, and the FPL is the percent capillary density loss (relative to normal mean) integrated over the LPA.

Measuring Glaucomatous Focal Perfusion Loss in the Peripapillary Retina Using OCT Angiography

David Huang, MD et al

- Main Outcome Measures
- Peripapillary retinal LPA and FPL.
- Results
- Among patients with POAG, 3 had preperimetric glaucoma and 44 had perimetric glaucoma, with visual field (VF) mean deviation (MD) of −5.14±4.25 decibels (dB). The LPA was 3.40±2.29 mm^2 in those with POAG and 0.11±0.18 mm^2 in normal subjects ($P < 0.001$). The FPL was 21.8%±17.0% in those with POAG and 0.3%±0.7% in normal subjects ($P < 0.001$).
- The diagnostic accuracy as measured by the area under the receiver operating curve was 0.965 for both LPA and FPL, with a sensitivity of 93.7% at 95% specificity. The repeatability as measured by intraclass correlation coefficient was 0.977 for LPA and 0.958 for FPL.
- The FPL had excellent correlation with VF MD (Spearman's rho = −0.843), which was significantly ($P = 0.008$) better than the correlation between NFL thickness and VF MD (rho = 0.760). The hemispheric difference correlation between FPL and VF (Spearman's rho = 0.770) was significantly ($P < 0.001$) higher than the hemispheric difference correlation between LPA and VF (rho = 0.595).

Measuring Glaucomatous Focal Perfusion Loss in the Peripapillary Retina Using OCT Angiography
David Huang, MD et al

- Conclusions
- The low-perfusion map and LPA and FPL parameters are able to assess the location and severity of focal glaucoma damage with good agreement with VF.

Glaukos Enters into a Collaboration and Marketing Agreement with Radius XR, Inc.

Advancing Next-Generation Wearable Patient Engagement and Diagnostic Technology Designed to Enable More Efficient Detection of Eye Diseases

Aliso Viejo, CA – July 17, 2023 – Glaukos Corporation (NYSE: GKOS), an ophthalmic medical technology and pharmaceutical company focused on novel therapies for the treatment of glaucoma, corneal disorders and retinal diseases, announced today that it has entered into a collaboration and marketing agreement with Radius XR, Inc., whereby Glaukos will become the exclusive sales agent to market, promote and solicit orders for the Radius XR™ wearable patient engagement and diagnostic system within the United States. Radius will continue to lead development and commercialization efforts for Radius XR.

Radius XR Strategic Imperatives

Elevate engagement to breakthrough competitive and cluttered landscape

- Deployment strategy leveraging GKOS relationships, products, and IG Initiatives
- Utilize tip of the sphere influencers to move market

Prove efficacy

- Utilize study data to establish equivalency with HFA
- Leverage clinical data to drive differentiation with “other headsets”

Capitalize on practice efficiency

- Elevate value proposition of patient engagement that can deliver greater efficiencies to a practice
- Identify and share case studies of practices that have incorporated Radius XR into their standard of care

- Radius is a portable vision diagnostic and patient engagement system that combines
  - Medical-grade diagnostics
  - Business management
  - Patient education tools
- In a single wearable AR/VR device
- The total hardware and software system helps medical professionals:
  - Diagnose patients accurately
  - Grow their eyecare practices
  - Enhance patient engagement
  - Reduce staff workload by enabling patients to perform self-guided vision exams with minimal supervision

GLAUKOS & radius XR

RADIUS IN-CLINIC DASHBOARD

allows you to monitor, control and observe live status of all devices within your clinic.

CORNEAL HYSTERESIS:
The Newest Disruptive Technology
In Glaucoma

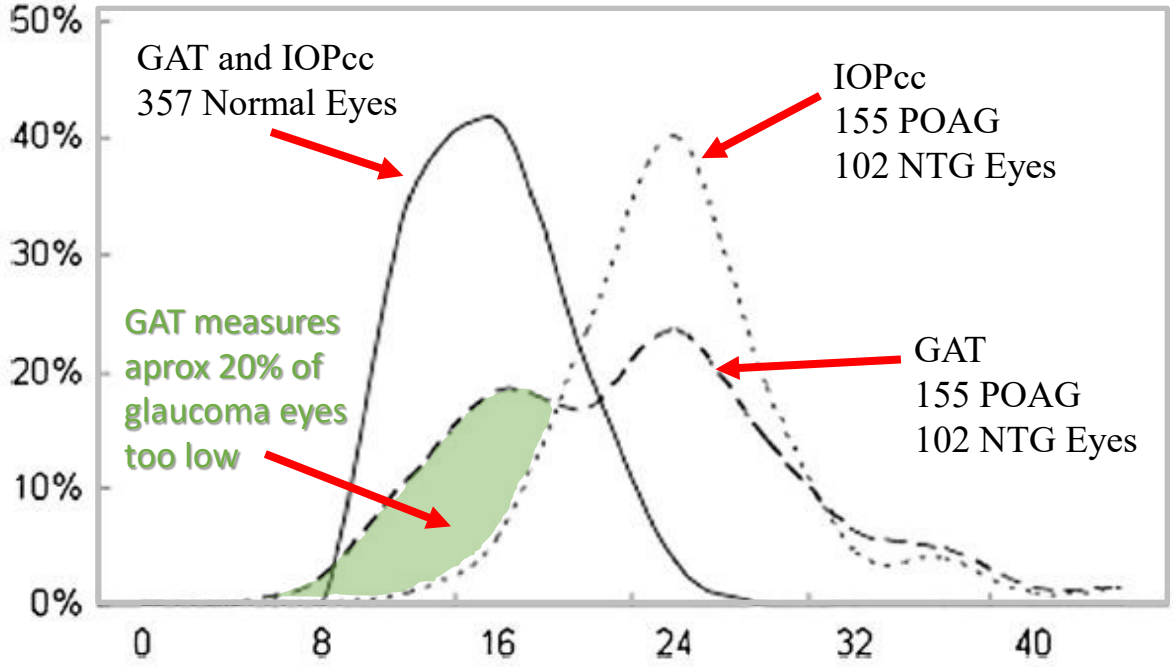
- **2002: Clinical research with ORA commences**
- **2005: The 1st generation ORA was made commercially available**
- **2012: Generation II ORA was launched**
- **3rd Generation "ORA G3" introduced September 2015**

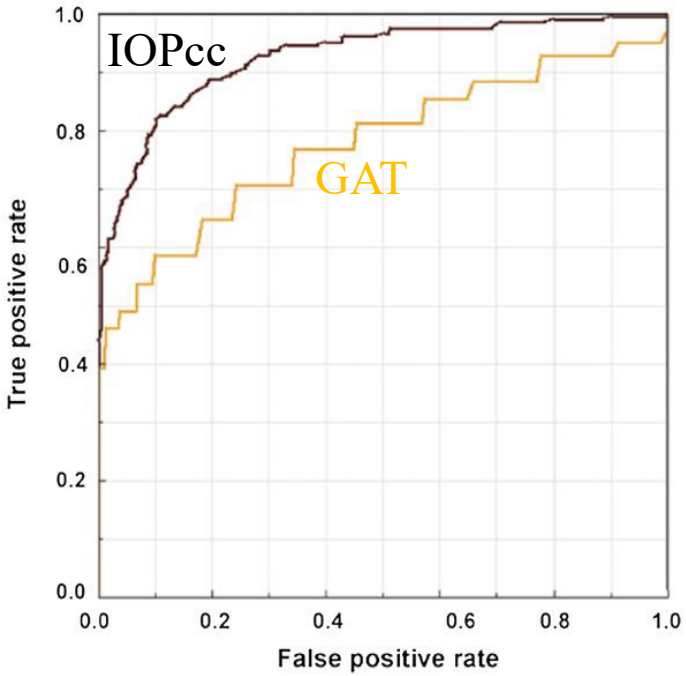
  Measures:
  - Corneal Hysteresis (CH)
  - Goldmann-correlated IOP (IOP_g)
  - Corneal compensated IOP (IOP_{CC})

IOPcc Key Benefit #2
IOPcc is superior for glaucoma risk assessment

IOPcc is clinically superior to GAT, other NCTs, and iCare because it is more associated with Glaucoma risk, status of glaucoma, and glaucoma progression

"the results of this study suggest that IOPcc may represent a superior test for the evaluation of glaucoma"





AUC .93 for IOPcc vs .78 for GAT

Not shown here from this study:

- **39%** of NTG eyes would be re-classified as POAG with IOPcc
- Average IOPcc was **5 mmHg higher** than GAT in NTG eyes

Goldmann applanation tonometry compared with corneal-compensated intraocular pressure in the evaluation of primary open-angle Glaucoma
Joshua R Ehrlich, Nathan M Radcliffe, and Mitsugu Shimmyo

Corneal Compensated IOP

- Superior to Goldmann in all forms of post Refractive Surgery IOP measurements

Central Corneal Thickness and Corneal Hysteresis Associated With Glaucoma Damage

NATHAN G. CONGDON, MD, MPH, AIMEE T. BROMAN, MA, KAREN BANDEEN-ROCHE, PHD, DAVINDER GROVER, MPH, AND HARRY A. QUIGLEY, MD

- 230 POAG or suspected POAG patients were included in the study
- 3 years or more FU
- Minimum 5 VF exams

	OR	LCL	UCL	*P*-value
Age per year <65	1.12	1.01	1.24	.03
Age per year >65	1.08	1.01	1.15	.02
GAT IOP per mmHg	1.22	0.95	1.58	.12
Treatment	1847.6	3.16	10^6	.02
IOP by treatment interaction	0.79	0.61	1.03	.08
CCT per 100 microns	1.65	0.66	0.98	.30
Years with glaucoma	1.00	0.96	1.04	.98
Baseline IOP	0.99	0.93	1.06	.79
CH per mmHg	0.81	0.66	0.98	**.03**

GAT Goldmann Applanation Tonometry; IOP intraocular pressure; OR odds ratio; LCL lower confidence limit; UCL upper confidence limit. CCT Central Corneal Thickness; CH Corneal Hysteresis

Conclusions: Corneal Hysteresis was the parameter most associated with progressive field worsening

Congdon NG et al. *Am J Ophthalmol.* 2006;141:868-875.

BJO

Significance of corneal biomechanical properties in patients with progressive normal-tension glaucoma

Jong Hyuk Park, Roo Min Jun and Kyu-Ryong Choi

Br J Ophthalmol published online January 2, 2015

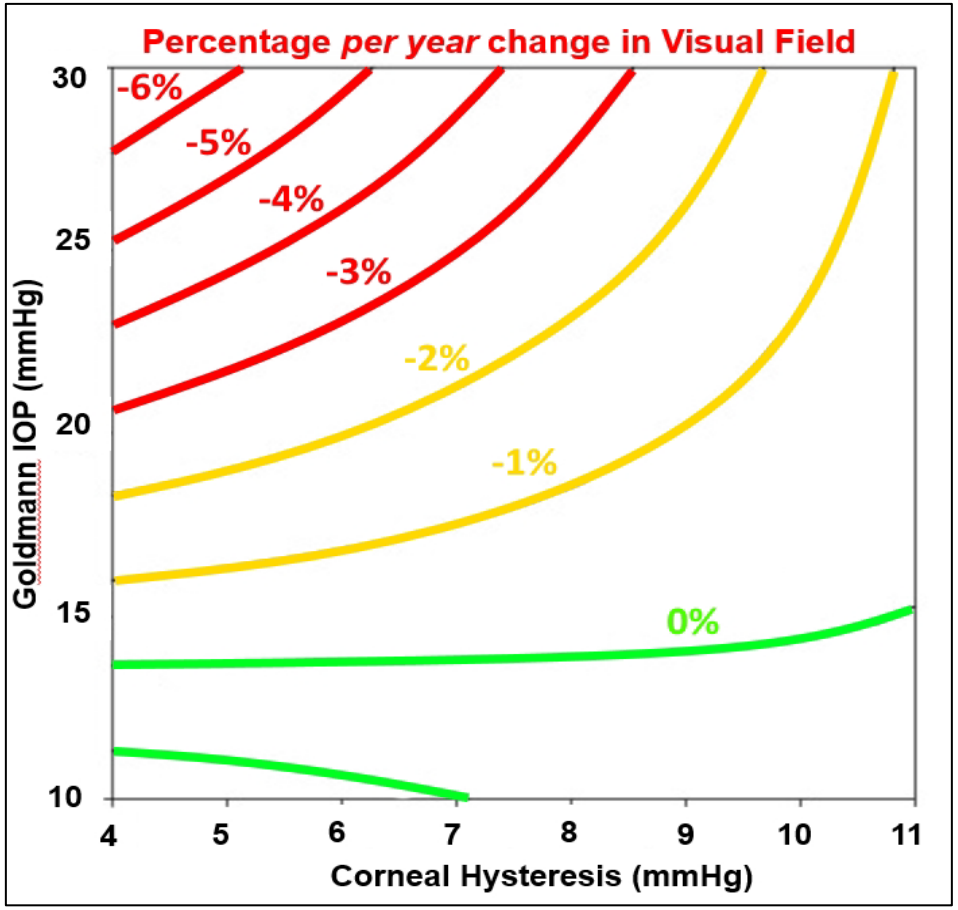
	β (95% CI)	*P-Value*
Baseline VF MD (dB)	1.18 (0.96 to –1.44)	0.12
CCT (µm)	0.99 (0.97 to 1.01)	0.35
Subfoveal choroidal thickness	0.99 (0.98 to 1.00)	0.08
RNFL thickness (average)	0.96 (0.92 to 0.99)	0.04
RNFL thickness (temporal)	0.97 (0.94 to 1.01)	0.09
RNFL thickness (inferior)	0.98 (0.96 to 1.01)	0.13
Corneal Hysteresis (mmHg)	0.32 (0.17 to 0.62)	<0.01

- 82 progressing eyes of NTG patients under treatment
- Eyes were split into two groups: higher & lower than average CH
- Of the **39 eyes with low CH, 26 (66.7%) showed progression**
- Of the **43 eyes with high CH, 15 (34.9%) showed progression**

These findings suggest that CH can be used as one of the prognostic factors for progression, independent of corneal thickness or IOP

Park Et. Al Br J Ophthalmol. 2015 Jan 2. pii: bjophthalmol-2014-305962. doi: 10.1136/bjophthalmol-2014-305962.

Corneal Hysteresis as a Risk Factor for Glaucoma Progression: A Prospective Longitudinal Study



The relationship between CH and IOP is complex (*and important*):

For eyes with lower CH, the impact of IOP was significantly larger than in eyes with higher CH levels.

"The Effect of IOP on rates of progression was *dependent upon Corneal Hysteresis*"

Medeiros FA et al. *Ophthalmology*. 2013;120:1533-1540.

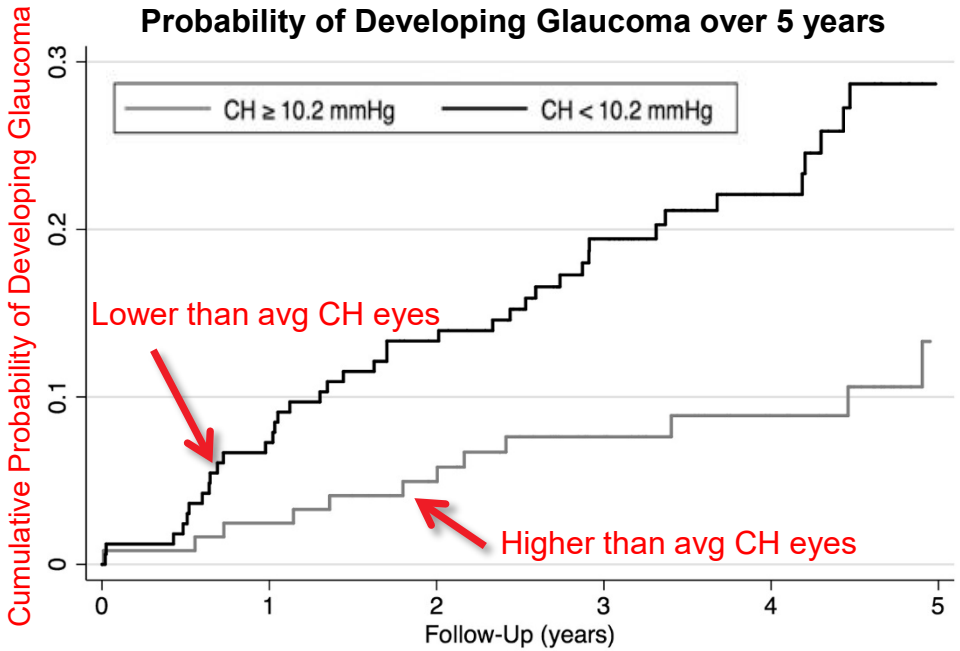
A Prospective Longitudinal Study to Investigate Corneal Hysteresis as a Risk Factor for Predicting Development of Glaucoma

CAROLINA N. SUSANNA, ALBERTO DINIZ-FILHO, FÁBIO B. DAGA, BIANCA N. SUSANNA, FEILIN ZHU, NARA G. OGATA, AND FELIPE A. MEDEIROS

Purpose: To investigate the role of CH as a risk factor for **development** of glaucoma in a prospective longitudinal study.

Results: Fifty four (19%) of the 287 eyes developed repeatable visual field defects during a 4 year follow-up.

CH was *independently* predictive of conversion to glaucoma even when adjusted for age, IOP, and CCT.

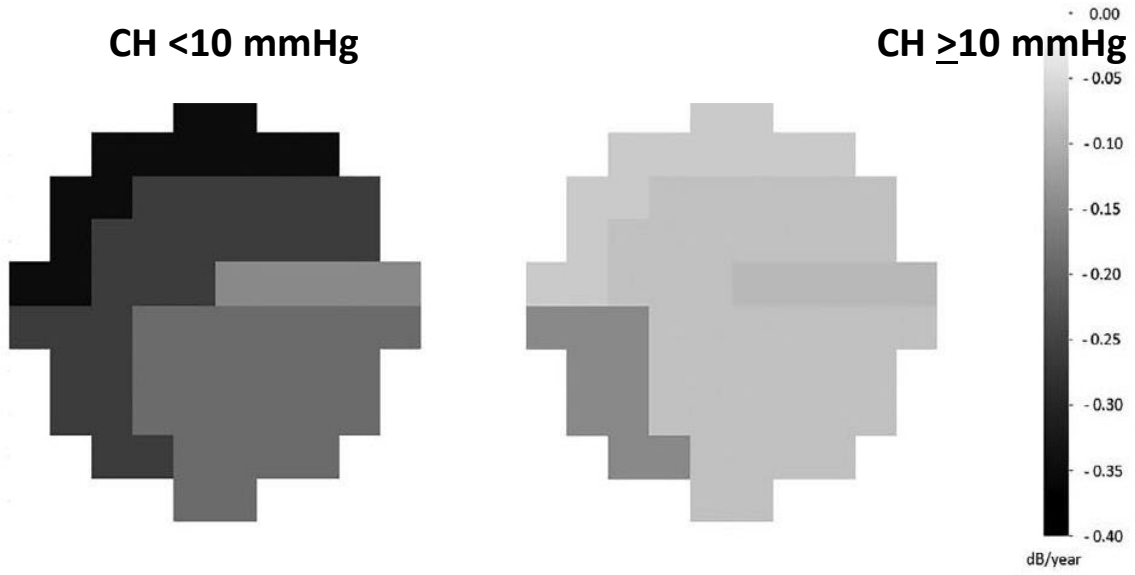


Each 1mmHg lower CH was associated with an increase of 21% in the risk of developing glaucoma during follow up

A Prospective Longitudinal Study to Investigate Corneal Hysteresis as a Risk Factor for Predicting Development of Glaucoma
Am J Ophthalmol. 2018 Mar; 187: 148–152. Feilin Zhu , Alberto DinizFilho, Linda M. Zangwill , Felipe A. Medeiros

CH as a Risk Factor for Central Visual Field Progression in Glaucoma

Zonal rates of change (dB/y) in the 10-2 test



"These results show that CH is a significant predictor of glaucomatous central and peripheral VF progression. Given the substantial influence of central VF impairment on the performance and quality of life, our findings suggest that CH should be considered in the risk assessment of disease progression in clinical practice."

Kamalipour A, Moghimi S, Eslani M, Nishida T, Mohammadzadeh V, Micheletti E, Girkin CA, Fazio MA, Liebmann JM, Zangwill LM, Weinreb RN. A Prospective Longitudinal Study to Investigate Corneal Hysteresis as a Risk Factor of Central Visual Field Progression in Glaucoma. Am J Ophthalmol. 2022 Mar 10;240:159-169. doi: 10.1016/j.ajo.2022.02.025. Epub ahead of print. PMID: 35278360.

INTRODUCING

Tono-Vera® Tonometer

and ReichertSync® Software

Canada Product Launch Presentation

Introducing…

Tono-Vera® Tonometer

Truly Objective Tonometry

Your guided view to precise IOP measurements

- Tono-Vera is Reichert's newest handheld tonometer used during routine eye exams by eyecare professionals: Opticians, Optometrists, Ophthalmologists and eyecare technicians
- The device measures intraocular pressure (IOP) of the human eye
- Utilizes rebound technology, which takes an IOP measurement quickly, eliminating the need for topical anesthesia
- ActiView™ Positioning System: ***quickly*** guides user to the apex of the cornea, providing ***confidence*** in IOP readings
- Automatically measures when aligned, providing a more objective and repeatable result in as few as **three measurements**
- Measurements are made using Ocu-Dot tonometer probes which are sanitized and single use. One probe per patient set of eyes
- The Tono-Vera System includes a charging* base that **conveniently stores and efficiently dispenses Ocu-Dot® Tonometer Probes**
- Features built-in Bluetooth® wireless data transmission via ReichertSync®
- Available in two models; Rechargeable or AA Battery

**rechargeable model only*

Camera view of the eye **with interactive alignment system** guides the user to the ideal distance and centration

When properly positioned, **takes IOP measurements automatically**

Reliable IOP results in **as few as 3 measurements.** Ring color indicates the **reliability of the measurement**

Innovative **FlexiSoft™ Forehead Rest** designed for more control and comfort

Differentiating Features	Reichert® Tono-Vera®	icare® ic100	CUSTOMER *Value*
Positioning Guide	ActiView™ Positioning System	None	Proper positioning is the key to reliable IOP measurements
Minimum Number of Measurements Required	3	6	Intelligent averaging permits accurate and reliable results in fewer measurements
Measurement Mode	Auto and Manual Modes	Manual Mode	True automatic measurement ensures faster and more reliable IOP results
Base & Storage Solutions	Included multi-purpose base	Suboptimal accessory	Perfect for docking and charging* your device while also storing and dispensing Ocu-Dot Probes
Battery	Rechargeable ***or*** Four- AA batteries option	Four AA Batteries	Battery options to meet your needs. Interchangeable battery solution for ultimate flexibility
Screen	Back of device	Lefthand side of device	Comfortable viewing for left or right-handed users
Bluetooth	Yes	No	Convenient Data Transfer, Eliminates transcription errors

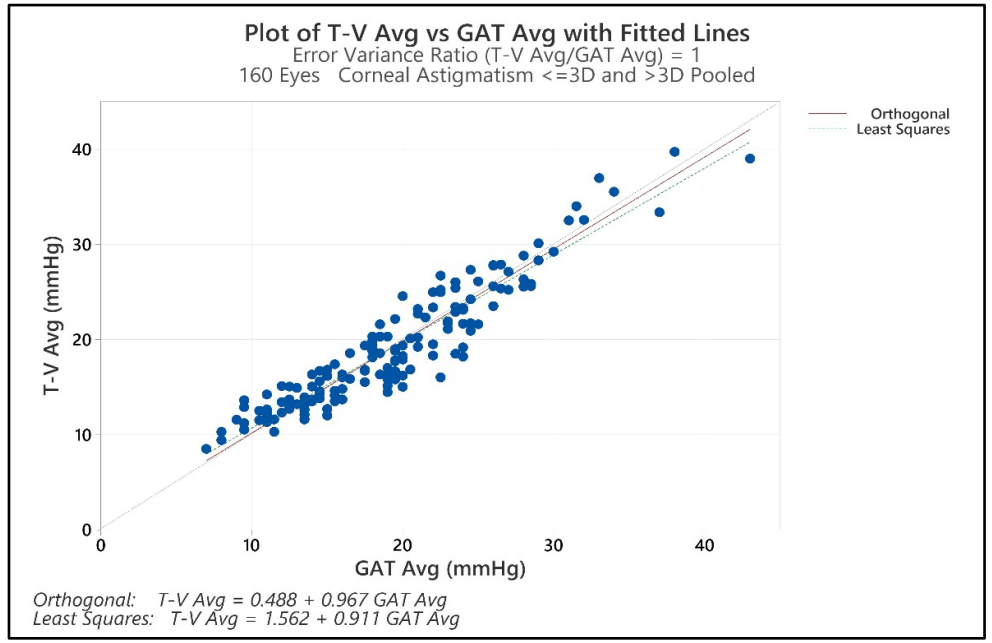
Tono-Vera® Tonometer – **Clinical Performance**

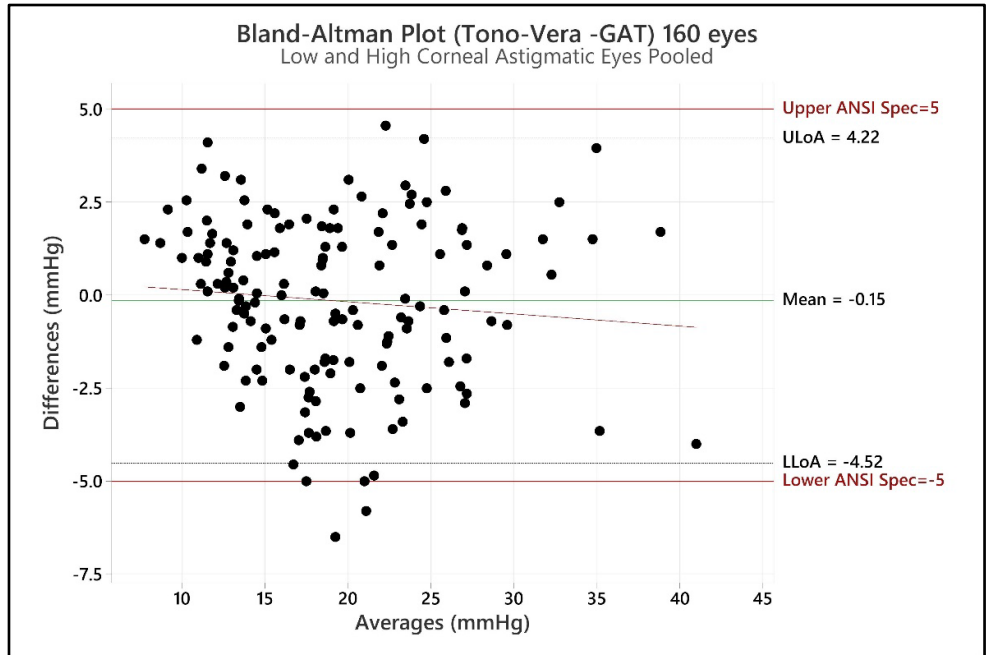
Results from FDA ANSI Z80.10 & ISO 8612-2009 trial

IOP Range (mmHg) Defined By GAT		Astigmatism	N Eyes	Average GAT IOP (mmHg)	Average TV IOP (mmHg)	Measurement Pair Difference > ±5 mmHg	Percentage of Measurement Pair Differences > ± 5 mmHg
Low IOP	7 to 16	≤3D	49	12.7	13.3	0	0.00%
Medium IOP	>16 to < 23	≤3D	43	19.6	19.1	1	2.27%
High IOP	≥ 23	≤3D	45	27.4	26.7	1	2.17%
Low IOP	7 to 16	>3D	11	13.1	12.9	0	0.00%
Medium IOP	>16 to < 23	>3D	10	19.4	18.2	0	0.00%
High IOP	≥ 23	>3D	2	27.0	26.3	0	0.00%
Total			160	19.17	19.03	2	1.25%

Average IOP values from Goldmann Applanation and Tono-Vera were not significantly different (19.17 and 19.03 respectively, p=0.40, paired t-test). The total least squares regression analysis indicated strong agreement between the two tonometers (slope +0.97, offset +0.49 mmHg, standard deviation 2.11 mmHg). Only 2 IOP measurement pairs that exceeded the + 5 mmHg limits of agreement required in ANSI Z80.10-2014 and ISO 8612-2009, which is within the range of acceptability specified in the standards.

Tono-Vera meets the requirements of ANSI Z80.10-2014 and ISO 8612-2009, demonstrating accuracy comparable to Goldmann tonometry.





Tonography: The New Horizon in Glaucoma Managment

Setting a Target Outflow Facility Value

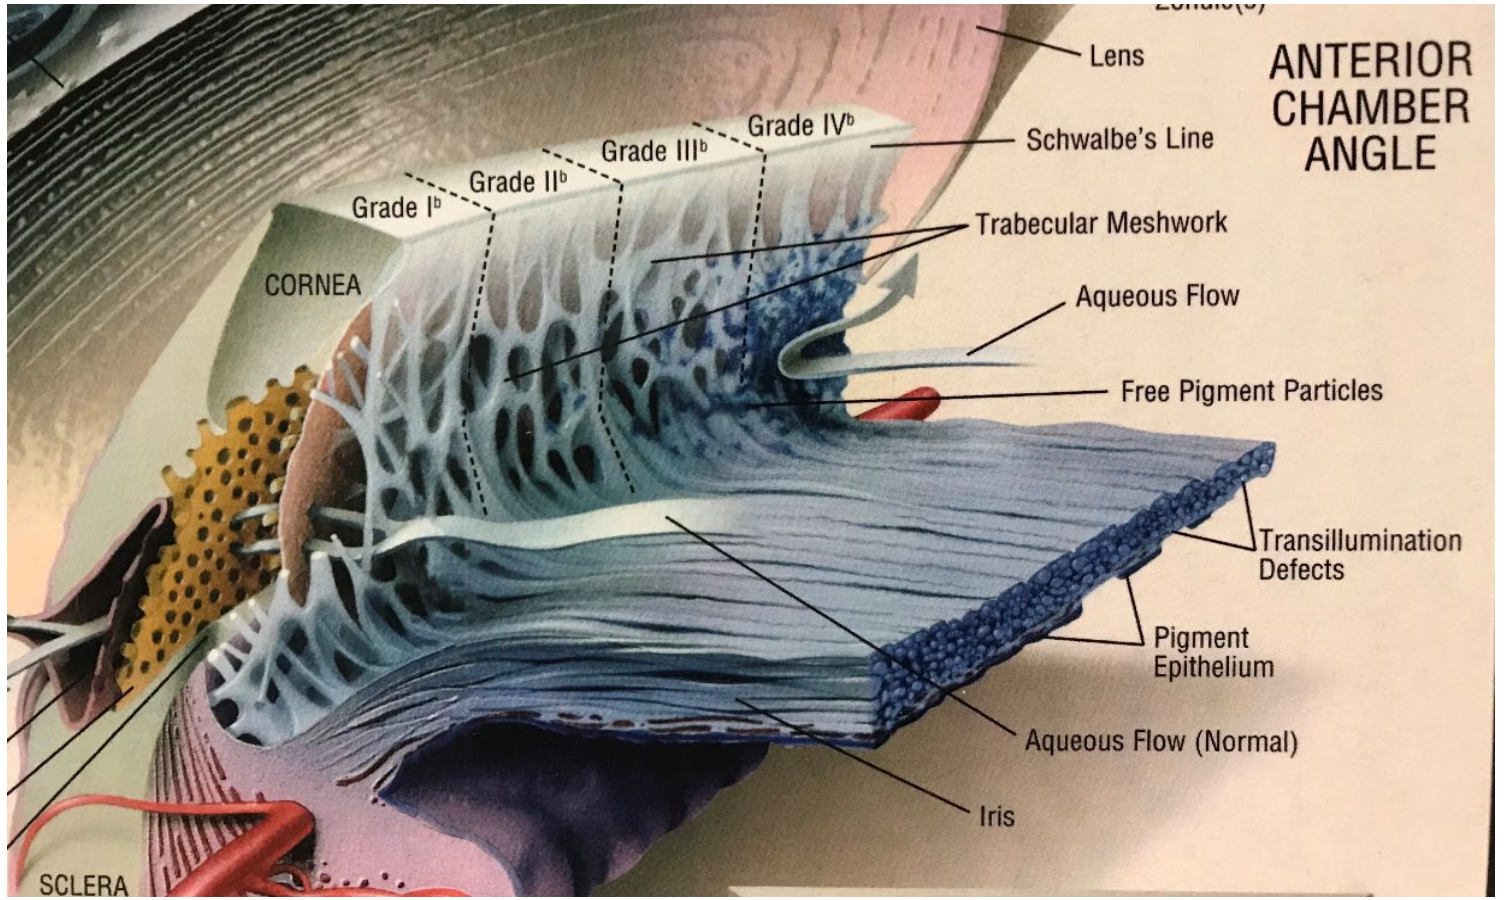
Is Measuring IOP Alone Enough?

- Does Not Validate Therapeutic Response
- Does Not Predict Risk
- Only Valid if You Obtain Multiple Measurements Over 24 Hours
- Patients with Untreated Glaucoma Can Have Normal IOP

Baltimore Eye Survey, Johns Hopkins University Study

Aqueous Humor Dynamics

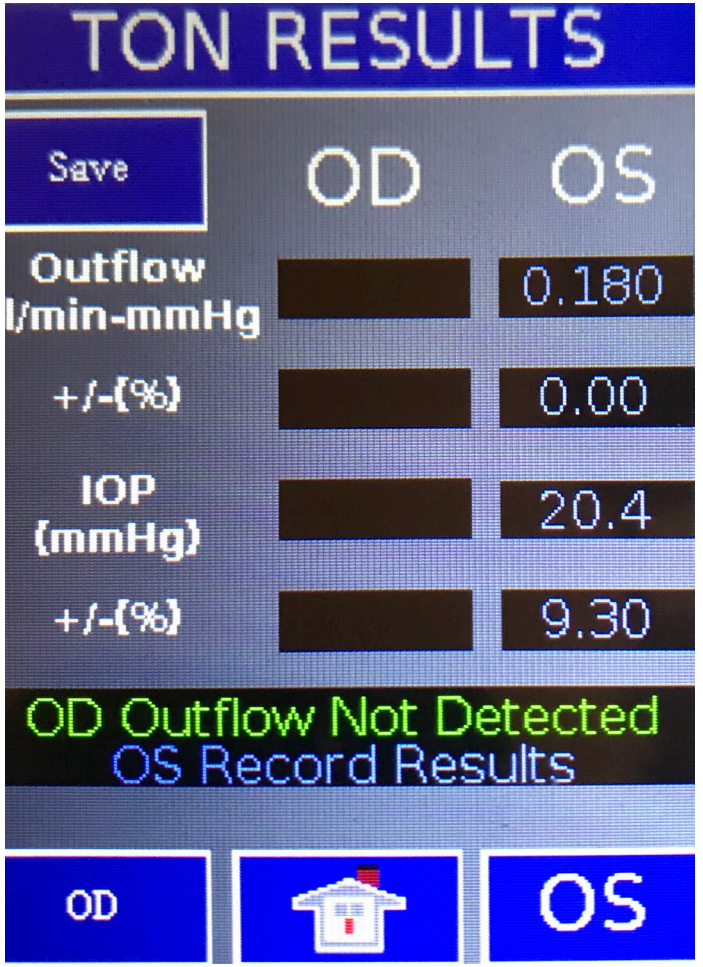
Aqueous Humor Outflow Pathway



Falck Medical Multisystem

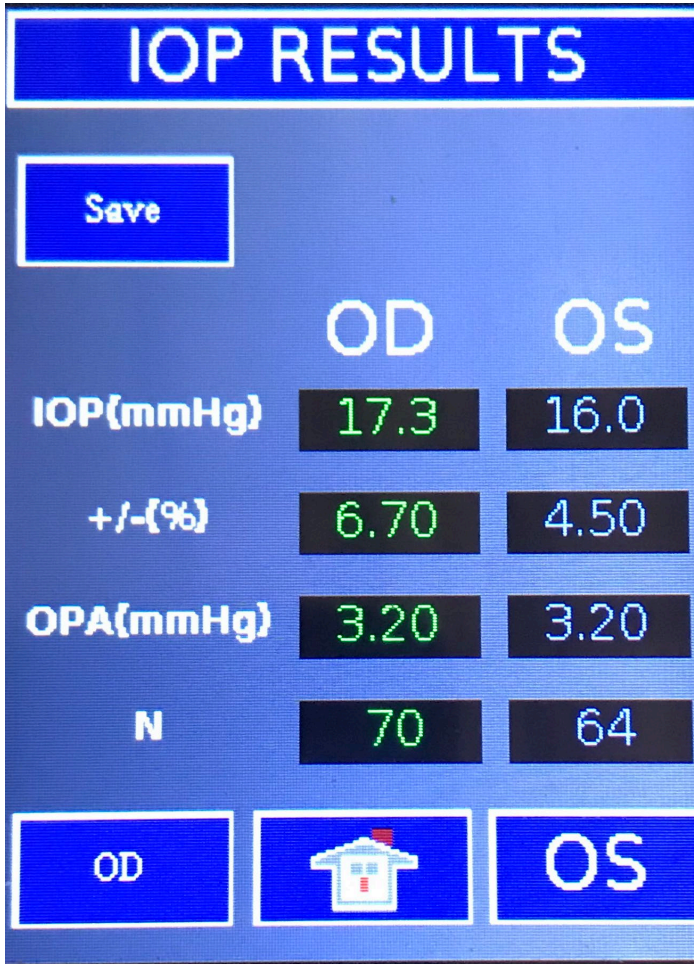
TONOGRAPHY

- ✓ Optical Aqueous Humor Outflow Measurement.
- ✓ Aqueous Outflow Decreased in Glaucoma.
- ✓ Decreased Outflow = Increased TM Resistance.
- ✓ Decreased Outflow = Increased IOP Fluctuation.
- ✓ Document Therapeutic Efficacy of Outflow Interventions.
- ✓ Document Need for Additional Intervention.
- ✓ Glaucoma risk assessment.



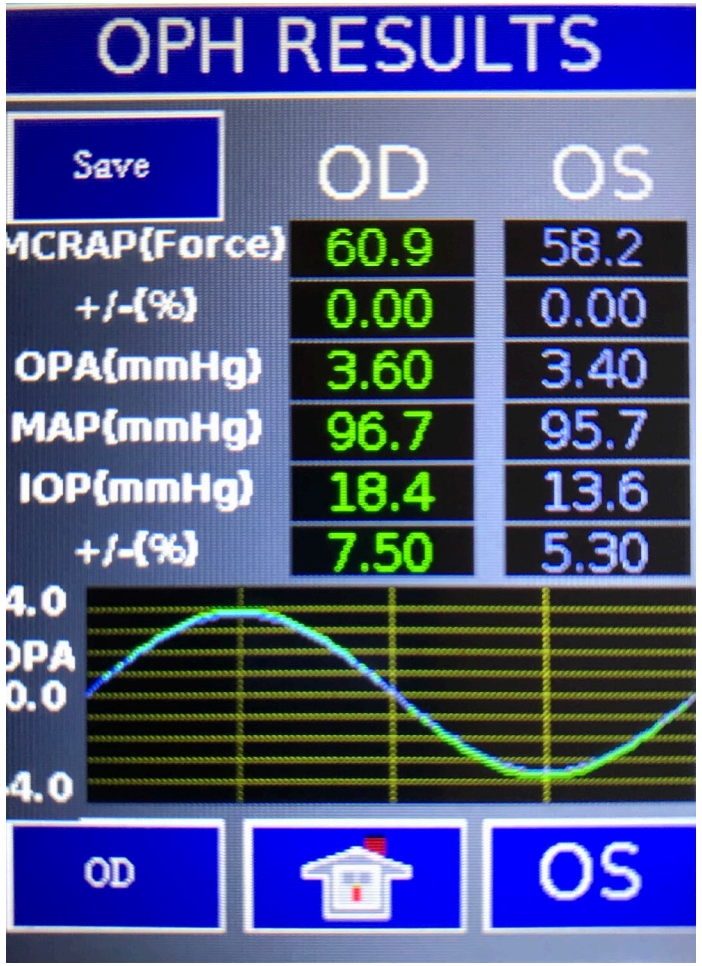
Intraocular Pressure

- ✓ Optical Applanation Measurement
- ✓ Compensates for Corneal Biomechanics
- ✓ Multiple Serial IOP Measurements – N Value
- ✓ Systolic and Diastolic IOP
- ✓ Average IOP Displayed
- ✓ IOP Variation with Cardiac Cycle - OPA
- ✓ Precision Displayed



OPHTHALMODYNAMOMETRY

- ✓ Mean Central Artery Pressure (MCRAP) measurement.
- ✓ Data Captured During Multiple Cardiac Cycles.
- ✓ Mean Arterial BP Displayed.
- ✓ MCRAP – IOP = True Ocular Perfusion Pressure (OPP).
- ✓ Reduced OPP is a risk factor for glaucoma progression.
- ✓ Abnormal OPH - Increased Risk of Stroke



Aqueous Humor Dynamics

- IOP is directly related to aqueous humor production and inversely related to aqueous humor outflow.
- The rate of aqueous humor production is not constant.
- The rate of aqueous humor outflow is constant.
- IOP varies throughout the day.
- The variability of aqueous humor production is the source of IOP variation.
- Using IOP alone can lead to the incorrect conclusion.
- Eyes with untreated glaucoma may have normal IOP when evaluated.
-

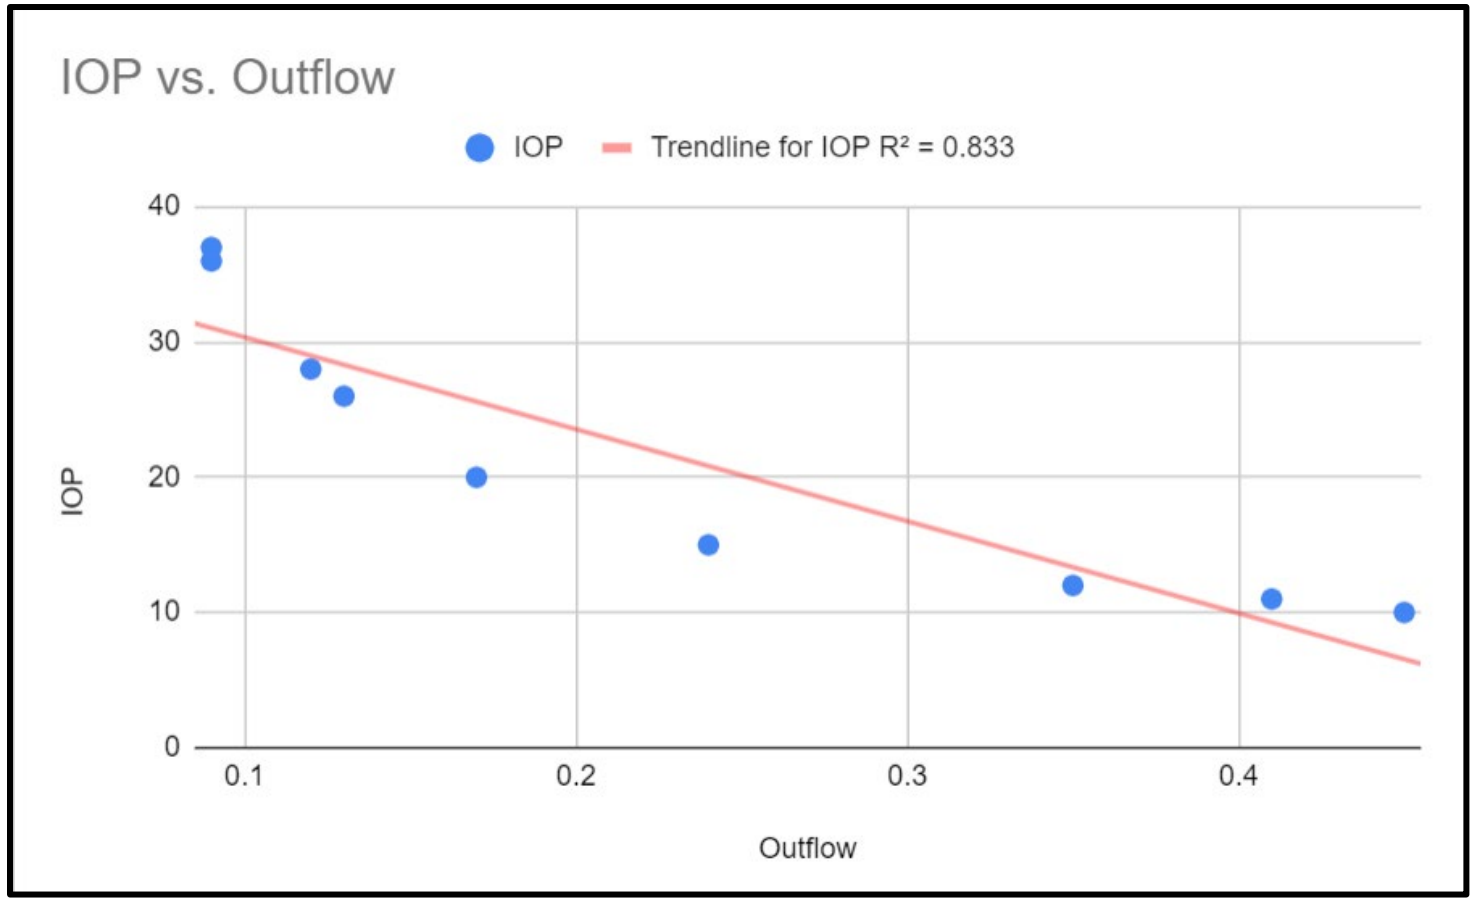
Why Measure Outflow Facility?

- Impaired Outflow Facility is the Primary Cause of Glaucoma
- Outflow Facility Measurements Predict IOP In and Out of the Office
- New Technology Available to Measure Outflow Facility - FMAT1 Tonography
- Outflow Facility Measurements Predict Risk

Reference: Chandler and Grant’s Glaucoma

Outflow Facility Measurements Predict IOP

- FMAT1 FDA Clinical Study Confirms
- IOP = (- 68)(Outflow) + 37, r^2= - 0.83



- **Eqiunox the Future of Glaucoma Therapy**

Thomas W Samuelson,[1] Tanner J Ferguson,[2] Nathan M Radcliffe,[3] Richard Lewis,[4] Justin Schweitzer,[5] Russell Swan,[5] and John P Berdahl[5]

Equinox

- Dr. Berdahl and colleagues studied 51 patients whose IOPs were 16 mm Hg.
- The investigators programmed a 25% pressure decrease into the goggles and the IOPs decreased to about 13 mmHg
- When a 50% pressure reduction was programmed into the goggles the IOPs decreased to about 11 mmHg, and with a 75% pressure reduction the IOPs decreased to about 10 mm Hg, he reported.

Triggerfish Contact Lens Monitor

- Provides 24 hour IOP monitoring, including the sleep period
- Takes measurement every five minutes
  - 288 times per day
- At the five minute measurement, obtains 300 data points
  - 10 Hz for 30 seconds
- Main concern is that instrument does not provide IOP measurement
  - Provides change in corneal curvature, based upon peripheral corneal measurement that correlates with change in IOP
  - Detect fluctuations in IOP

Triggerfish Contact Lens 24-Hour IOP Monitoring Device

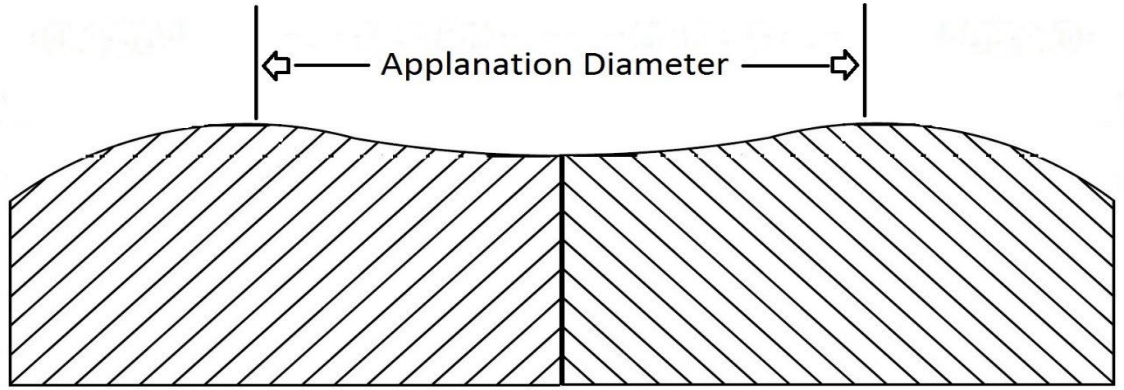
CATS: Correcting Applanation Tonometry Surface

Inventor Sean McCafferty MD

Sean McCafferty is an Ophthalmologist with a degree in Mechanical Engineering and a Master of Science in optical engineering. This unique combination of skills equipped him to envision the CATS™ Tonometer Prism design in 2011.

After years of work, the device became FDA cleared in October 2018.

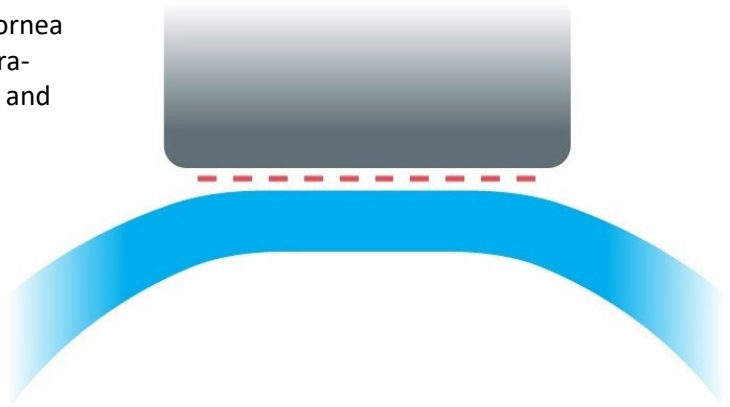
CATS is simply a replacement prism for any Goldmann applanation or Perkins tonometer. The CATS Tonometer Prism™ utilizes a concave contact surface to minimize mechanical bending resistance of the cornea. The device also features a tapered edge, which helps to reduce the influence of tear-film adhesion.



CATS: Correcting Applanation Tonometry Surface

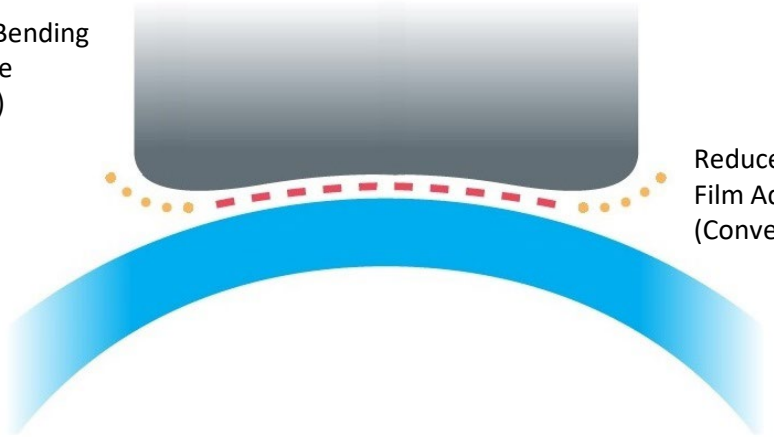
Traditional GAT Prism – No change in 65 Years

Flattens the Cornea Amplifying Intra-Corneal Stress and IOP errors



CATS™ Tonometer Prism – the New Shape of IOP

Reduces Bending Resistance (Concave)



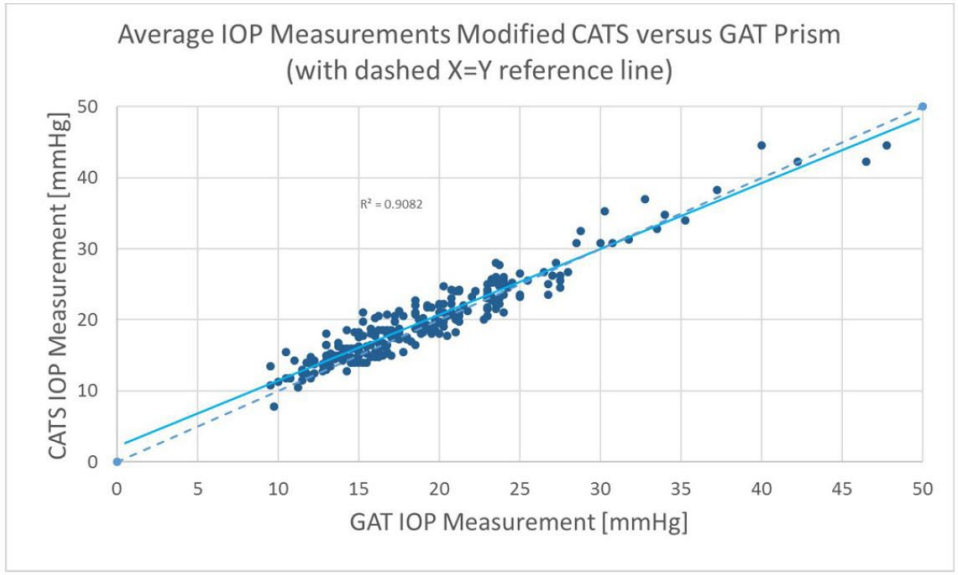
Reduces Tear Film Adhesion (Convex)

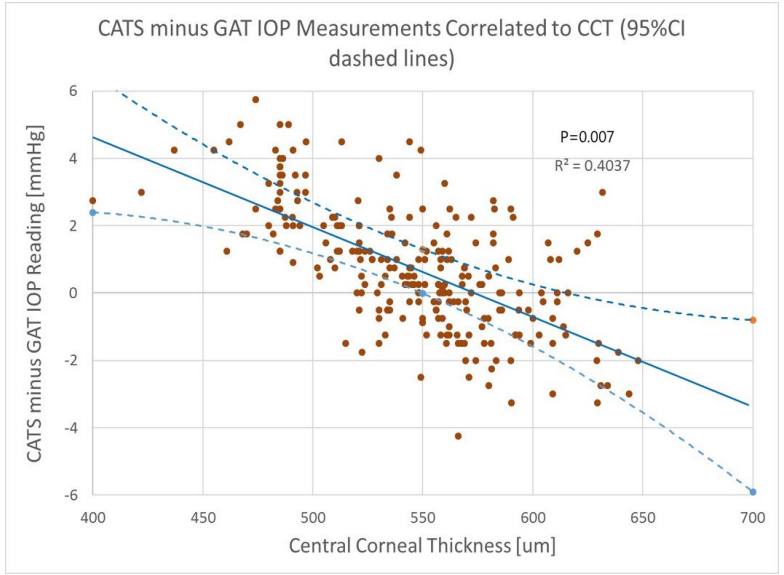
CATS: Compare CATS to GAT in Normal Eyes

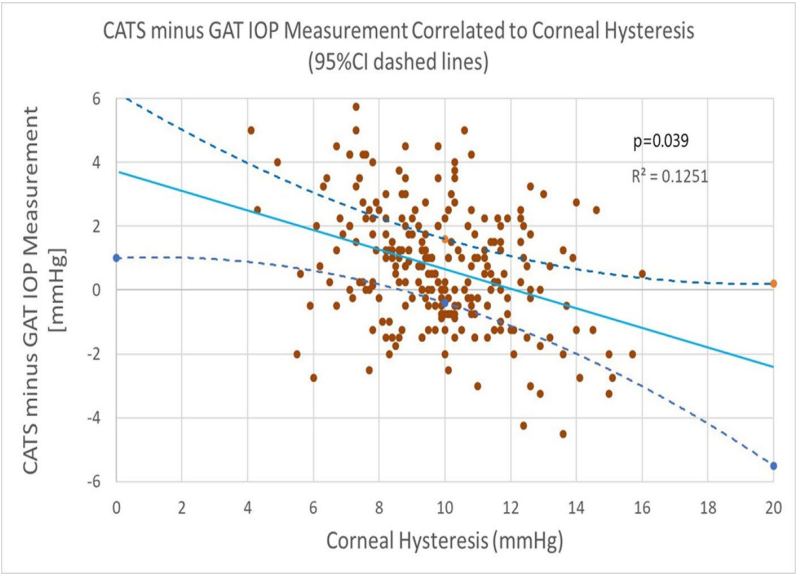
Purpose:

1. Compare CATS to GAT in 243 Normal Eyes with Central Corneal Thickness between 400 – 650 Microns

2. Evaluate the impact of corneal properties on GAT and CATS





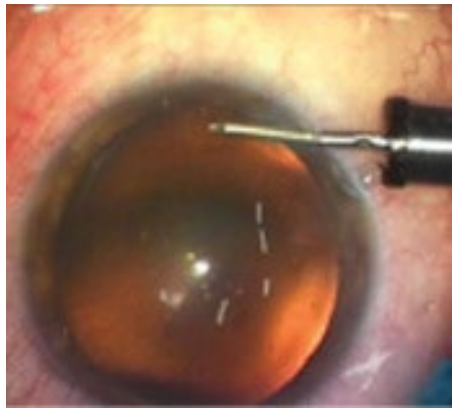


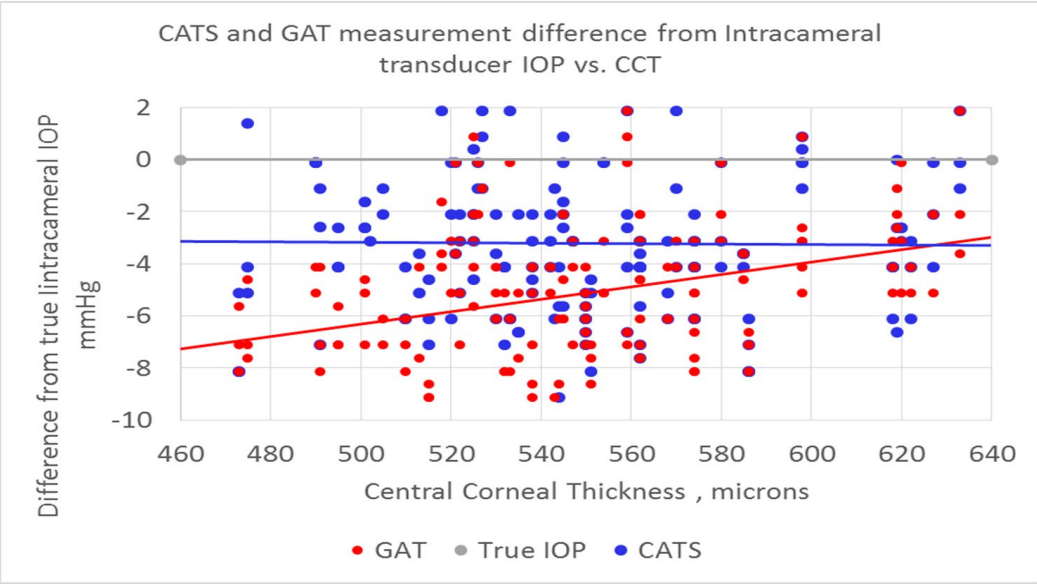
A significant reduction in CATS prism's sensitivity to CCT and CH was demonstrated compared with the traditional GAT prism

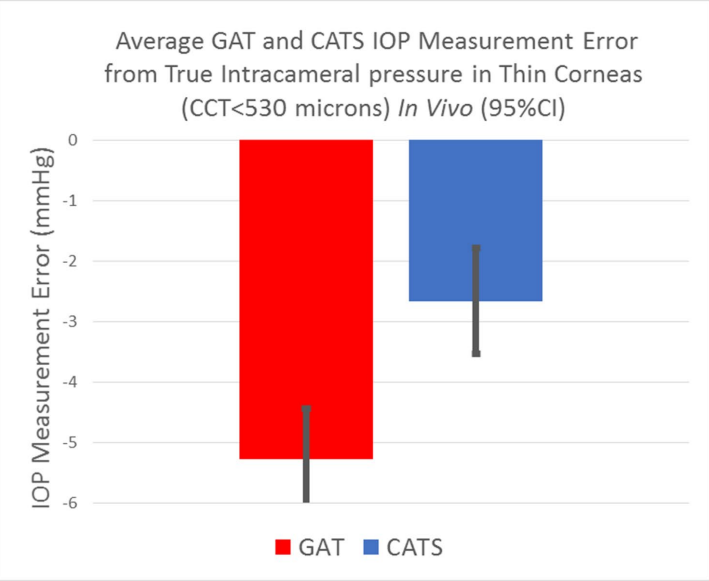
CATS Intercameral Pressure Validation

Methods:

- Intracameral IOP measured on 58 eyes undergoing cataract surgery
- IOP manometrically modulated to 10, 20, and 40 mmHg
- Difference between the CATS and GAT IOP measurements from true intracameral pressure correlated to the error parameters







The CATS prism is significantly more accurate compared to the GAT prism compared to true intracameral pressure, and is unaffected by CCT.

From The Bedside to the Bench and Back Again: Predicting and Improving the Outcomes of SLT Glaucoma Therapy

Jorge A. Alvarado, MD,* Rumiko Iguchi, MS, Richard Juster, PhD, Julie A. Chen, MD, and Amde Selassie Shifera, MD

IOP DIFFERENCE (MM HG) BETWEEN CONDITIONS

IOP, intraocular pressure; N, number; SD, standard deviation; PGA, prostaglandin analogue; SLT, selective laser trabeculoplasty.
*All *P* values are for the paired *t* statistic and are 2-sided.

N EYES = 24	**A. MEAN % DIFFERENCE (SD)**	**B. MEAN % DIFFERENCE (SD)**
IOP_{PGA}-$IOP_{BASELINE}$	−5.58 (2.38); $P < .001$*	−25.37% (8.86); $P < .001$
IOP_{SLT}-$IOP_{BASELINE}$	−6.60 (2.44); $P < .001$	−29.93% (7.05); $P < .001$
IOP_{SLT}-IOP_{PGA}	−1.02 (1.81); $P = .011$	−5.33% (11.39); $P = .031$

Alternate Day Therapy

- Twice daily dosing increases IOP relative to once daily dosing
- Xalatan and Lumigan combined can increase IOP, even to 50s
- anytime IOP is >30 with prostaglandin, it is overdosed
- Once daily can be overdose if there is inflammation/endogenous prostaglandin

Persistence of IOP Response

- Labovitz RA et al; Arch Ophth 2001
- Comparison of Lumigan vs: Timolol
- Maintenance of IOP at 48 hours post D/C 5.6mmHg
- 7.2 - 8.2 mmHg at peak effect
- 28 Day control showed less than
- Timolol was 3.4-3.9 mmHg at peak.

Alternate Day Therapy Post SLT

- SLT somewhat less effective in patients already on prostaglandin
  - Suggesting that part of SLT induces prostaglandin like effects
- QD prostaglandin could be an overdose after SLT
  - Especially first year after laser

GAPS: MPR for Retrospective Pharmacy Claims Data and Survey Patients

- All pharmacy claims
  - Mean, 0.64 (±0.42)

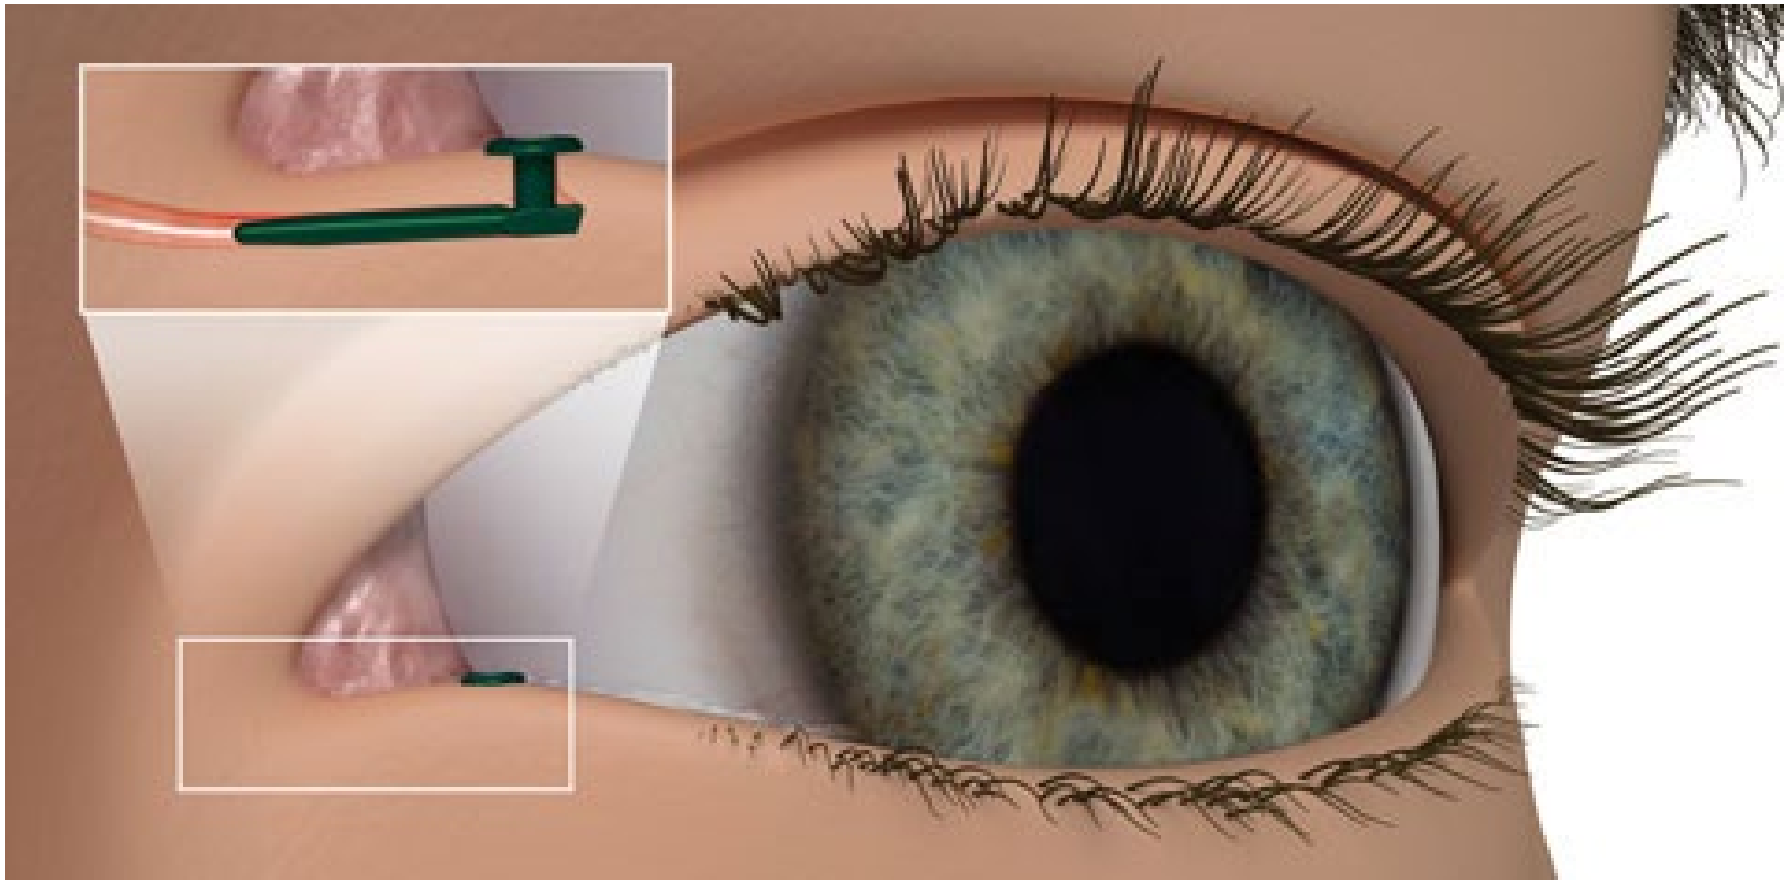
Mati Therapeutics

- The Evolute has an L-shaped design and is inserted into the nasolacrimal duct. The device is cosmetically invisible, but can be easily seen with eversion of the lower lid.
- The glaucoma product has a core of latanoprost-polymer matrix that is surrounded by silicone, and it delivers the medication into the tear film at a constant rate.
- In a phase II clinical trial, the latanoprost punctal plug was found to be comfortable. It was associated with a 20% lowering from baseline IOP over a 3-month period, and in two separate clinical trials.
- Retention rate of 92% and 96%, respectively.

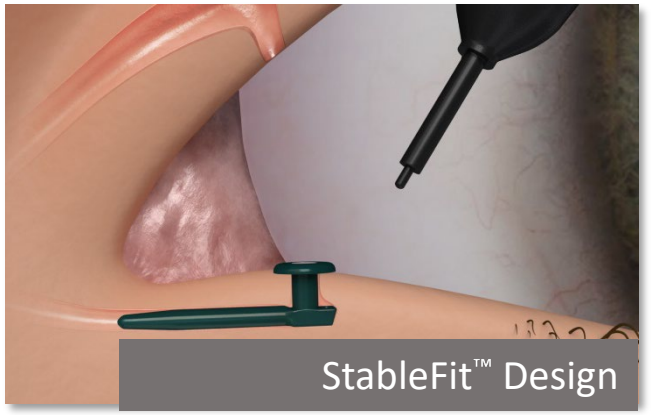
Mati Therapeutics

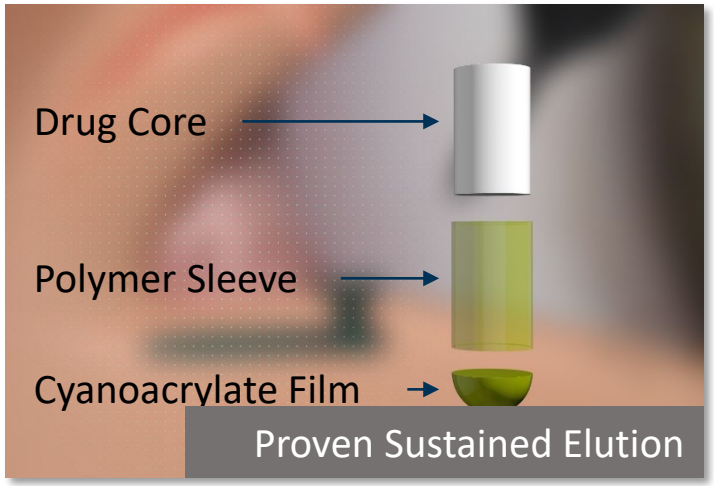


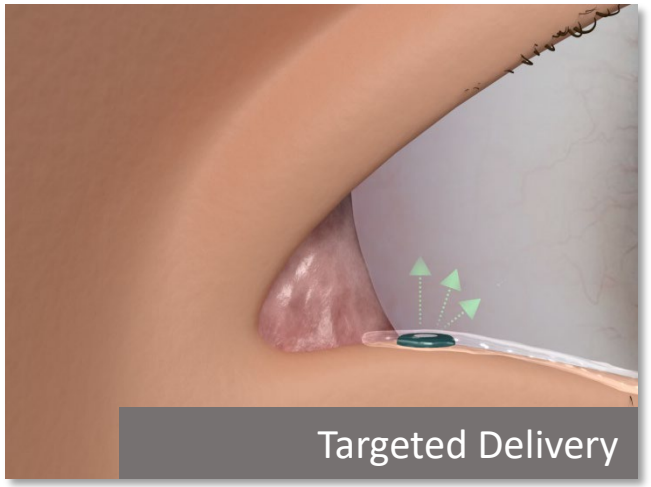
Evolute® Punctal Plug Delivery System

Successful By Design

1. Easy to place and remove
2. Cosmetically invisible – easy to identify
3. Tolerable
4. Consistent, sustained efficacy
5. Use in multiple disease states







Excellent Plug Retention Rates Over 12 Weeks

U.S. Phase II Multi-center Trials – Lower Puncta

Multiple Disease State Treatment Applications
Multiple compounds can be formulated with Evolute® Punctal Plug Delivery System
Glaucoma
Prostaglandins
• Latanoprost
• Travoprost
• Bimatoprost
Beta-Blockers
• Timolol
• Betaxolol
• Levobunolol
Alpha Agonists
• Brimonidine
NCEs
• Rho Kinase Inhibitors
• Adenosine agonists
Allergy
Antihistamines / Mast Cell Stabilizers
• Olopatadine
• Levocabastine
• alcaftadine
Mast Cell Stabilizers
• Cromolyn
• Nedocromil
Anti-Inflammatory
Steroids
• Difluprednate
• Loteprednol
• Fluorometholone
Dexamethasone
• NSAIDs
• Nepafenac
• Bromfenac
Dry Eye
Immunosuppressants
• Cyclosporine
Integrin antagonist
• Lifitegrast
OTC Demulcents / Oils / Emulsions

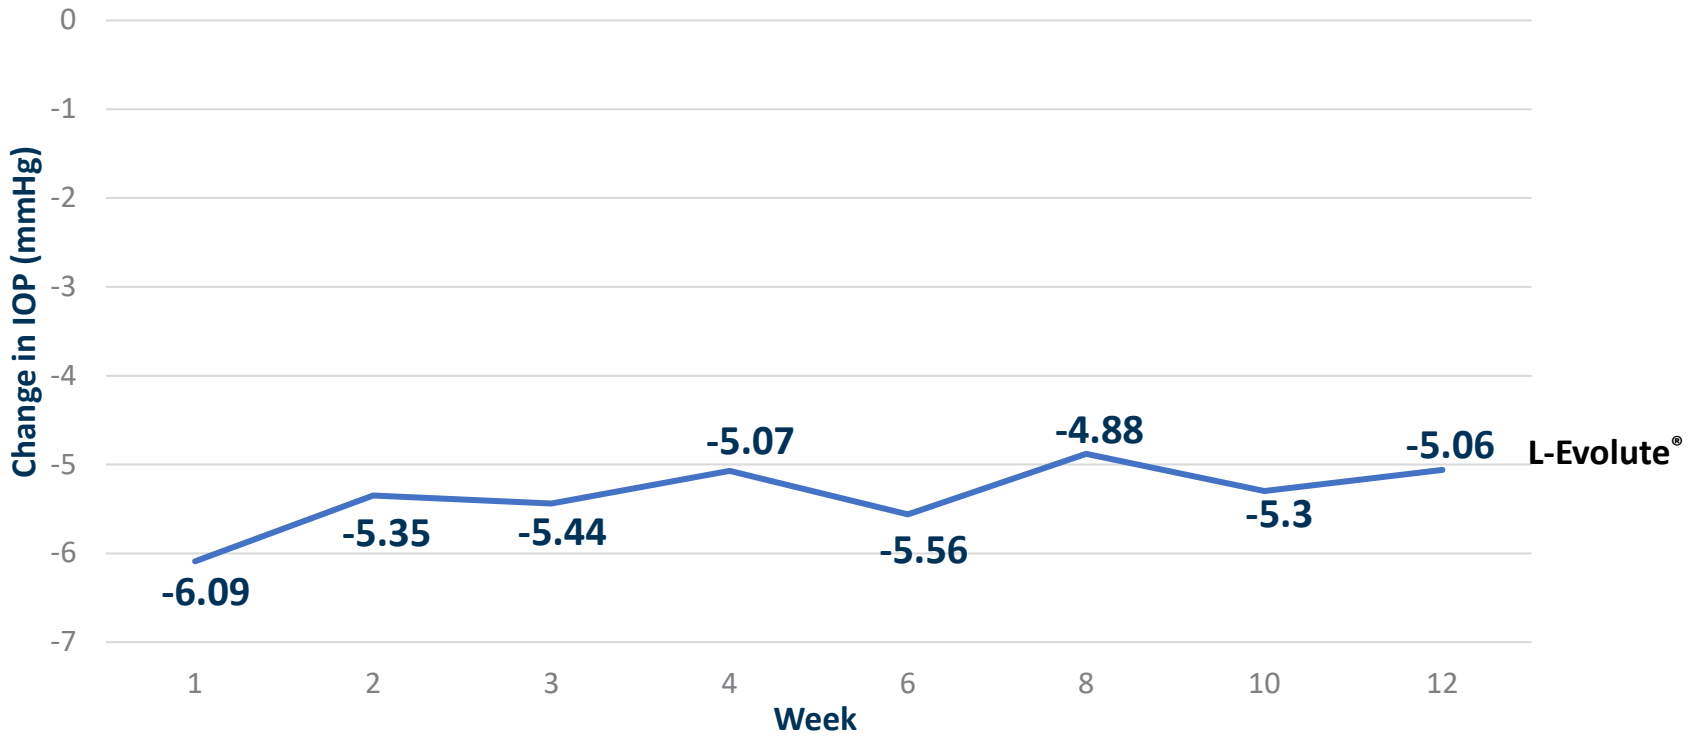
Ph II U.S. Multi-center 12 Week Results:

L-Evolute® with Previously Shown Elution Profile

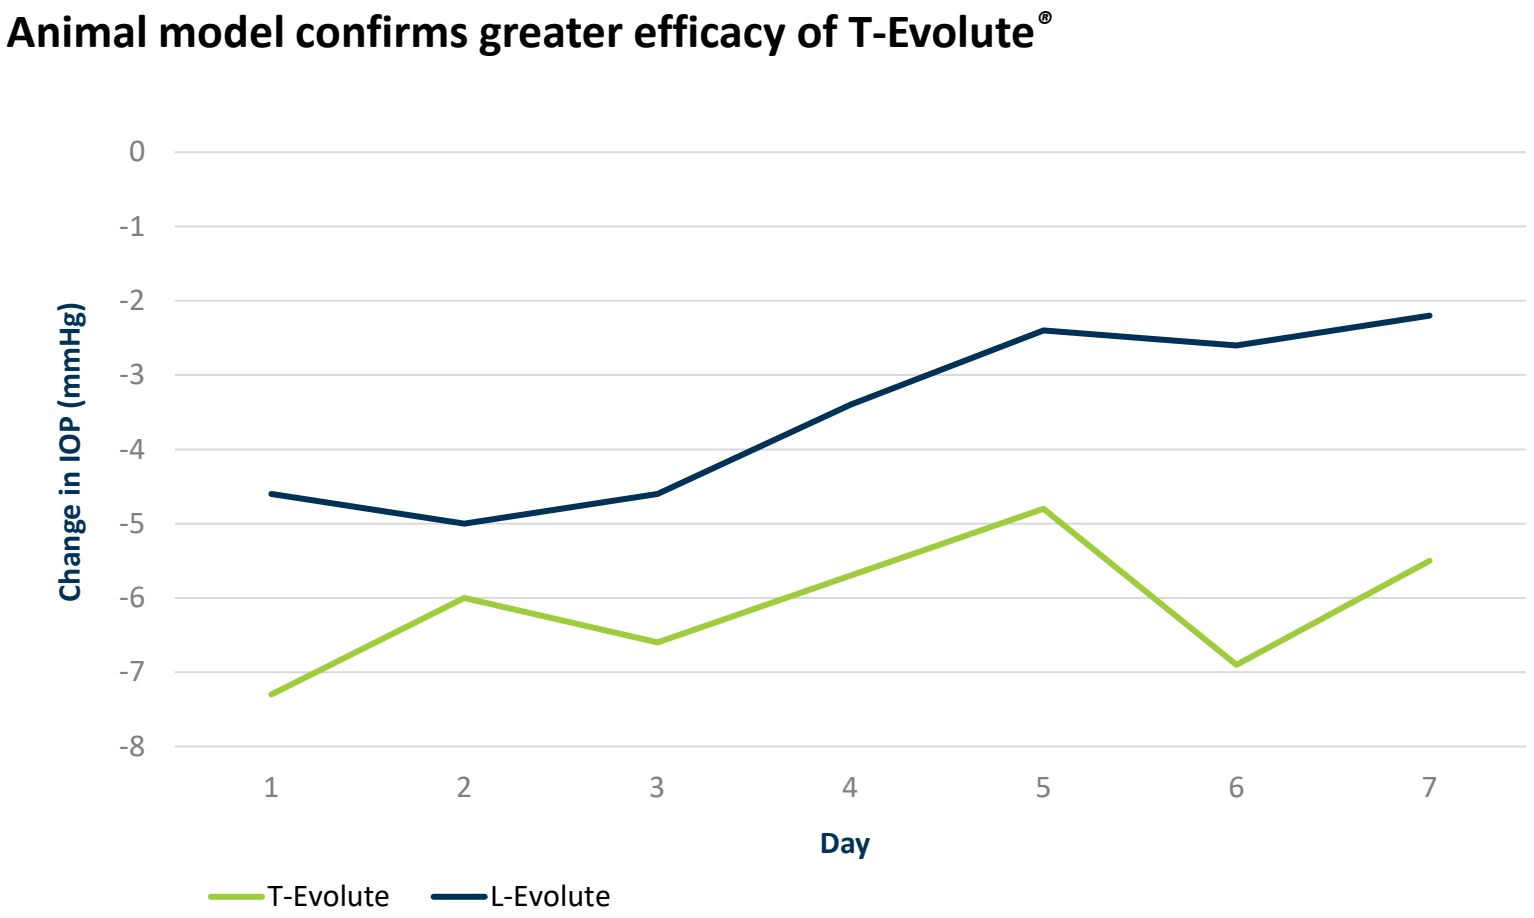
Development data to date shows the T-Evolute® should out perform the L-Evolute® shown above in humans



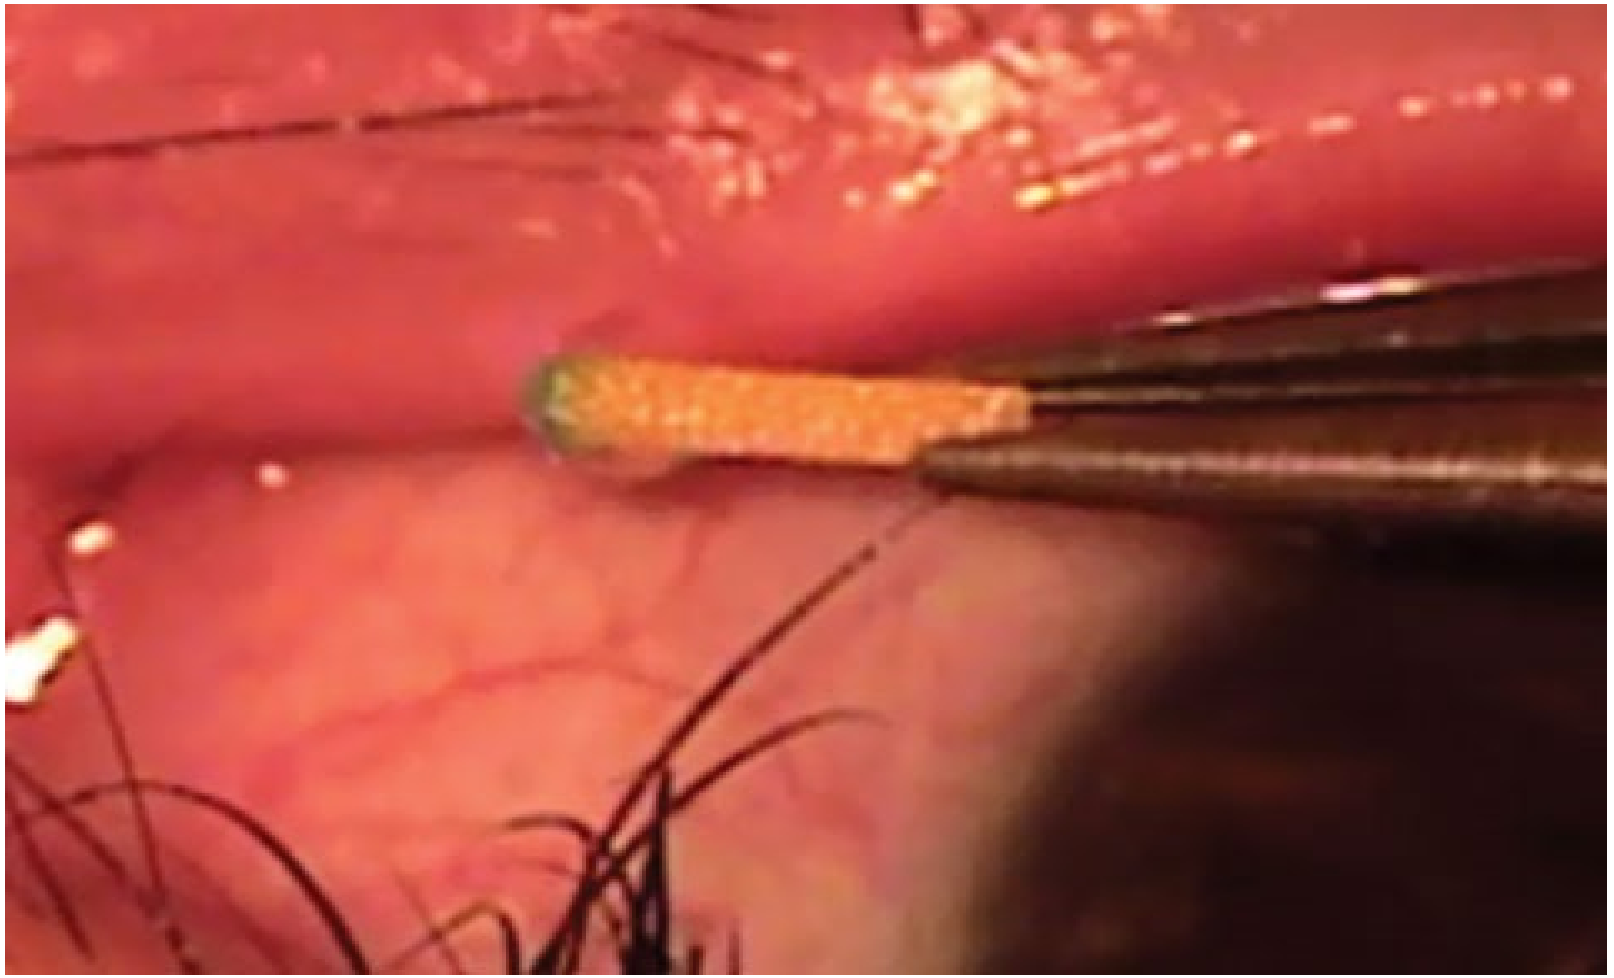
All IOP included, regardless of plug loss/removal

*95% CI excludes 0, indicating a p-value of <.05

Animal IOP Model (Mean Time Points) -Travoprost



Ocular Therapeutix



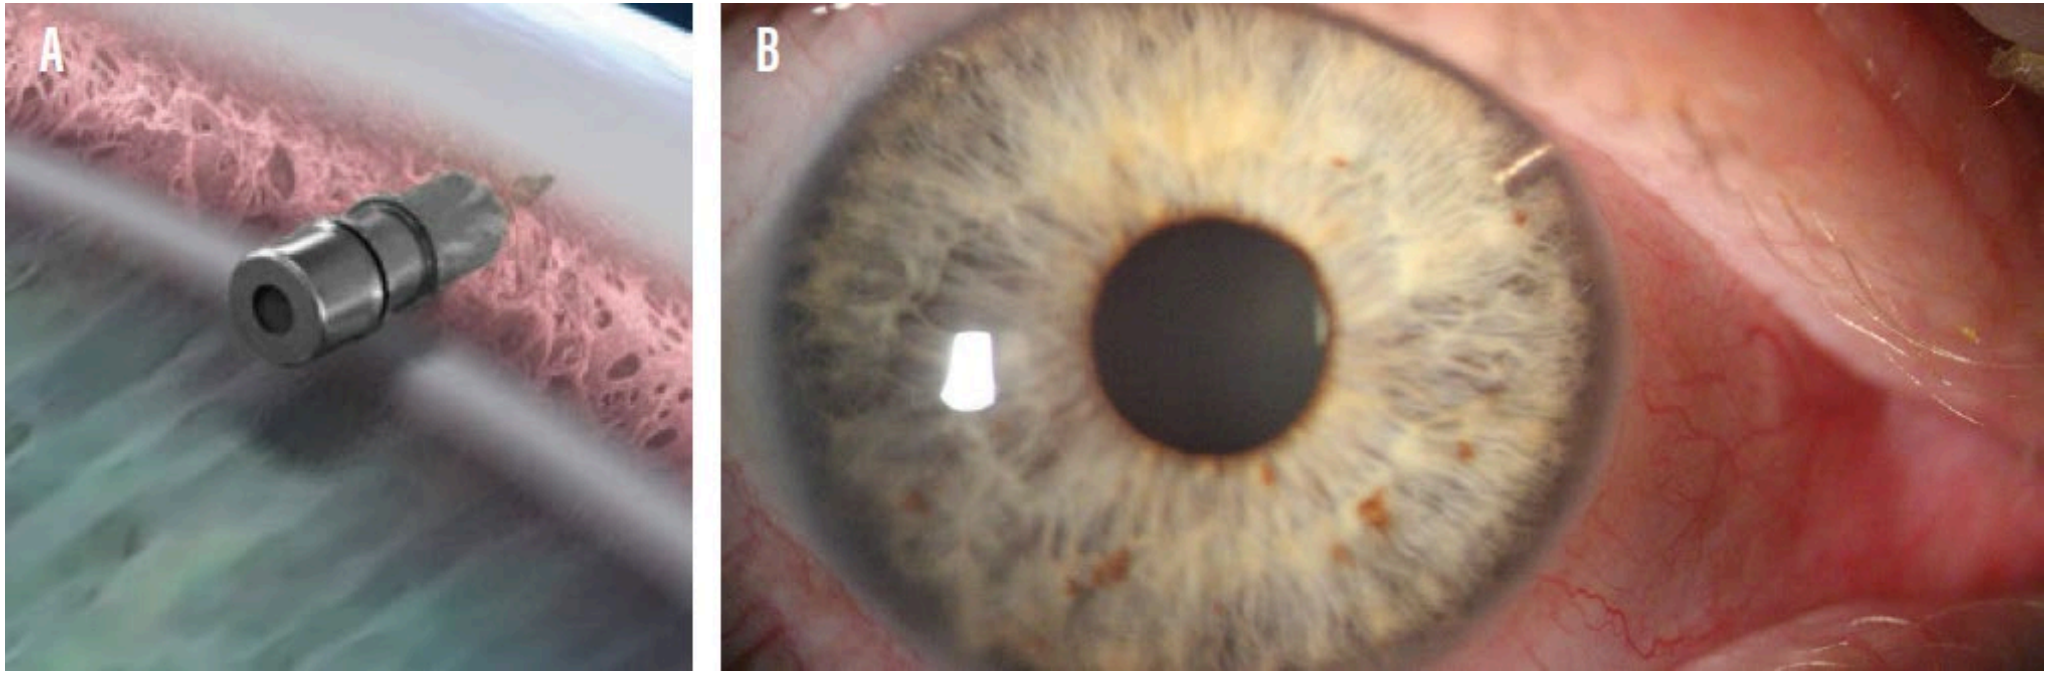
Ocular Therapeutix

- Phase II study randomly assigned 73 patients into two groups to receive either the travoprost plug with twice daily artificial tears or timolol 0.5% twice daily with placement of a drug-free punctal plug.
- At 90 days, there was a 4.5 to 5.7 mm Hg reduction from baseline IOP in patients who had the travoprost punctal plug, which was clinically meaningful.
- However, the control group had an average IOP lowering of 6.4 to 7.6 mm Hg.
- The safety profile was good—no hyperemia was seen. The retention rate at 60, 75, and 90 days was 91%, 88%, and 48%, respectively.

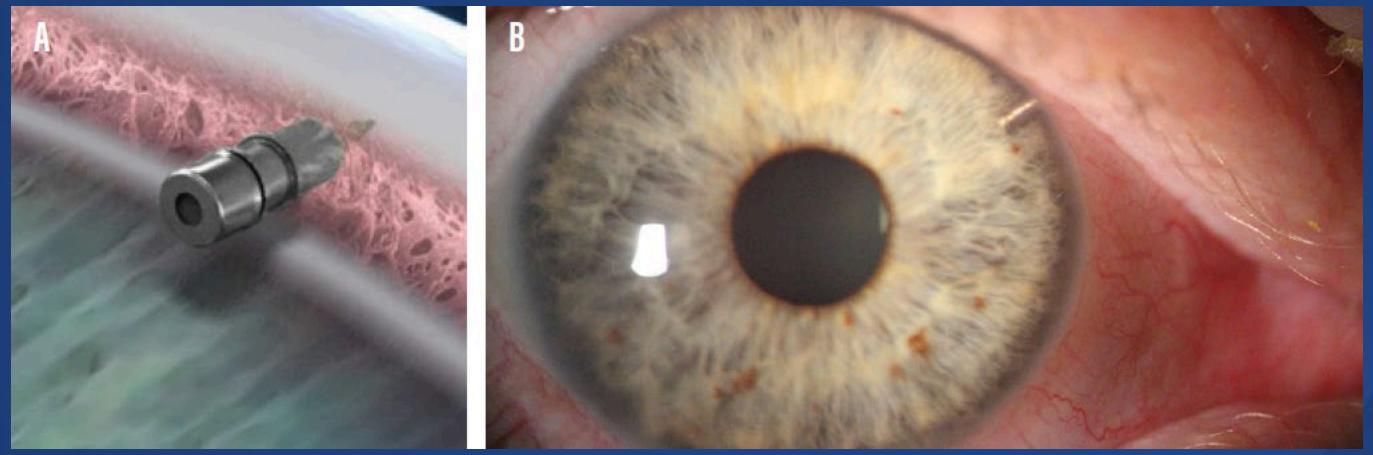
Glaukos iDose

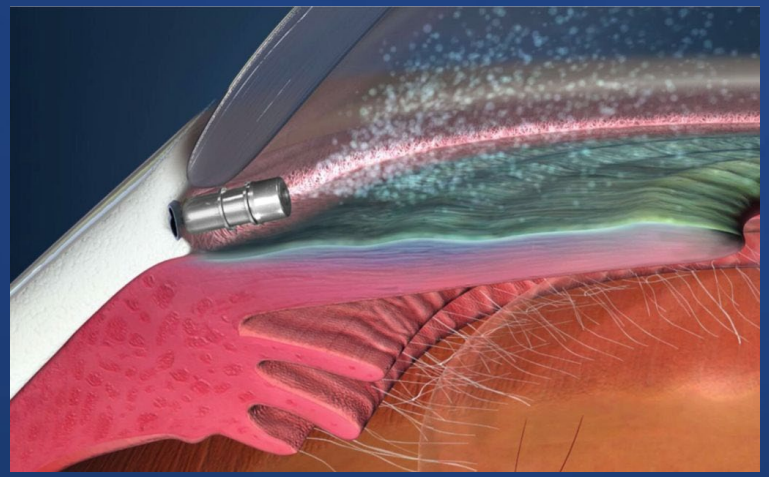
- The iDose is a titanium implant that is comparable in size to Glaukos' proprietary devices for microinvasive glaucoma surgery
- The 150-patient, multicenter, randomized, double-blind phase 2 trial evaluated two models of the iDose delivery system with different travoprost elution rates in comparison to a topical timolol maleate ophthalmic solution, 0.5%.
- The unit is filled with a formulation of travoprost specific to the device and capped with a membrane designed for continuous controlled drug elution into the anterior chamber.

Glaukos IDose TR



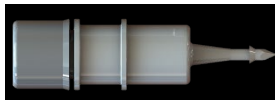
iDose-Travoprost Implant





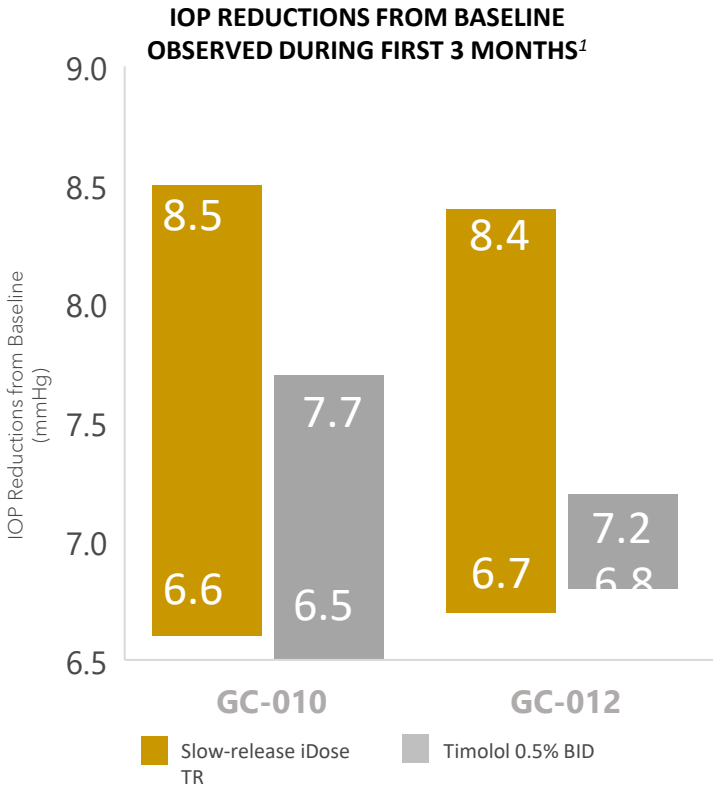
Glaukos Idose TR

- For each of the two Phase 3 *iDose TR* pivotal trials, GC-010 and GC-012, both the fast- and slow-release *iDose TR* arms achieved the pre-specified primary efficacy endpoint of non-inferiority to the active comparator arm (twice-daily topical timolol ophthalmic solution, 0.5%) through 3 months.
- For the GC-010 trial, the intraocular pressure (IOP) reductions from baseline over the first 3 months were 6.6-8.5 mmHg in the slow-release *iDose TR*arm, versus 6.6-7.7 mmHg in the timolol control arm (mm Hg range represents IOP reduction means across the six U.S. Food and Drug Administration (FDA) pre-specified timepoints of 8 a.m. and 10 a.m. at Day 10, Week 6 and Month 3).
- For the GC-012 trial, IOP reductions from baseline over the first 3 months were 6.7-8.4 mm Hg in slow-release *iDose TR* arm, versus 6.8-7.2 mmHg in the timolol control arm.
- 93% of slow-release *iDose TR* subjects remained well-controlled on the same or fewer IOP-lowering topical medications at 12 months compared to screening after a single administration of *iDose TR,* versus 67% of timolol control subjects in both Phase 3 trials.
- Additionally, 81% of slow-release *iDose TR* subjects were completely free of IOP-lowering topical medications at 12 months across both trials.



iDose Phase 3 data achieves primary efficacy endpoints

In 2 pivotal trials, iDose TR fast- and slow-release doses achieved pre-specified primary efficacy endpoints as agreed upon with US FDA (non-inferiority to topical timolol through 3 months)



- 1,150 subjects randomized across both Phase 3 trials
- Mean baseline IOP of ~24 mmHg in each study
- ~81% of slow-release iDose TR subjects had open-angle glaucoma; 19% ocular hypertension
- 67% of slow-release iDose TR subjects were on at least 1 IOP-lowering medication at screening, including 23% of subjects that were on 2 or more

1 mmHg range represents IOP reduction means across the six U.S. FDA pre-specified timepoints of 8AM and 10AM at Day 10, Week 6 and Month 3 ; iDose TR is not approved by the FDA

Phase 3 and Phase 2b duration data for iDose TR

	AT 12 MONTHS	AT 24 MONTHS	AT 36 MONTHS
PH 3	93%		
PH 2B	92%	72%	69%

Percentage of slow-release iDose TR subjects **well-controlled on the same or fewer IOP-lowering topical medications**

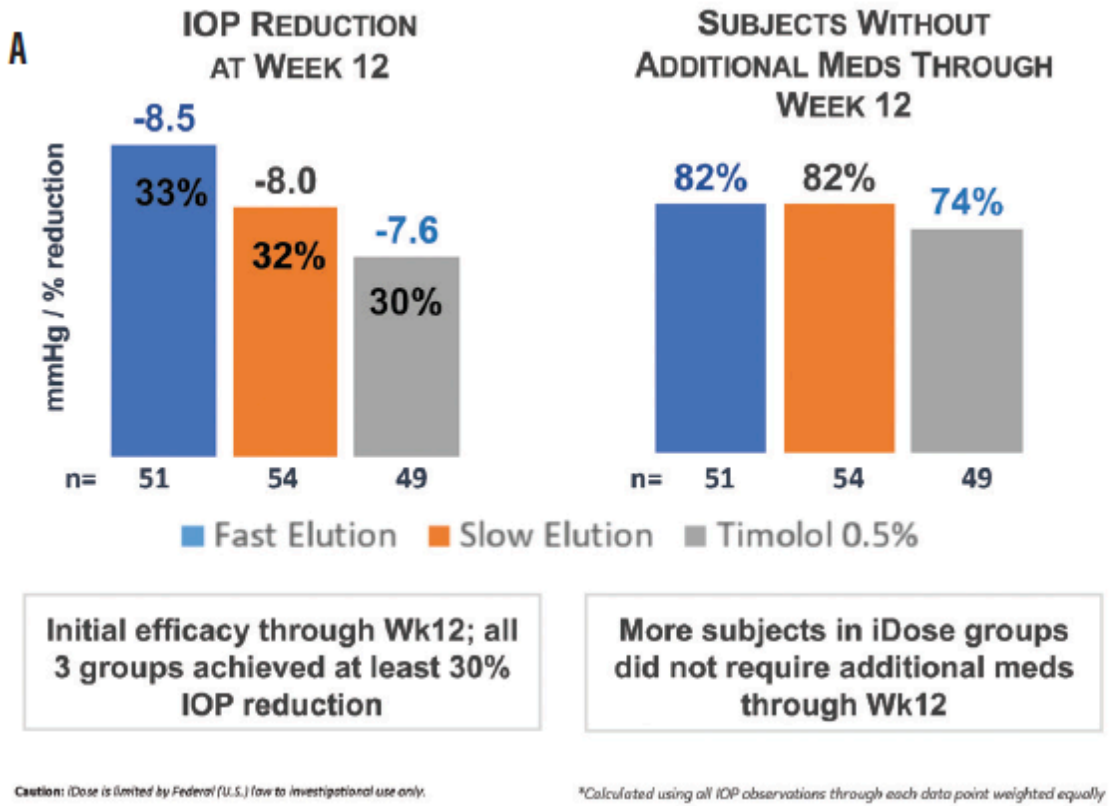
81% of slow-release iDose TR subjects in the Phase 3 trials were completely free of IOP-lowering topical medications at 12 months

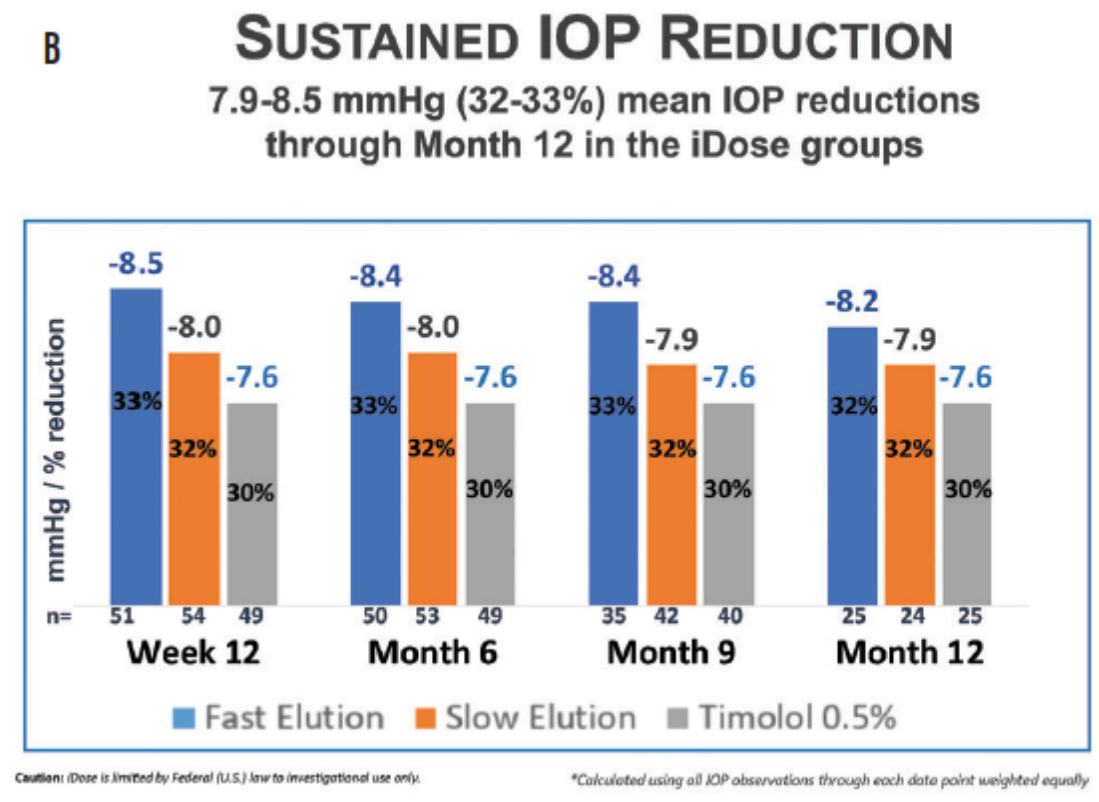
iDose TR is not approved by the FDA

Glaukos IDose TR

- *iDose TR* demonstrated excellent tolerability with 98% of slow-release *iDose TR* subjects continuing in the trial at 12 months, versus 95% of timolol control subjects across both Phase 3 trials.
- *iDose TR* demonstrated a favorable safety profile through 12 months, with no adverse events of corneal endothelial cell loss, no serious corneal adverse events and no adverse events of periorbital fat atrophy.
- Notably, conjunctival hyperemia occurred at a very low rate of 3% for slow-release *iDose TR* subjects. The most frequent adverse event for slow-release *iDose TR* subjects was mild transient iritis at a rate of 6% in both Phase 3 trials.
- In-office administration of *iDose TR* was successfully employed with various subjects across multiple sites with outcomes that were consistent with the Phase 3 trials, thus demonstrating the feasibility of *iDose TR* administration in the office setting.

Glaukos Idose TR





Glaukos IDose TR

- Results from the exchange trial demonstrated a second administration of *iDose TR* and removal of the original *iDose TR* implant was safe and well-tolerated, with the second *iDose TR* demonstrating a favorable safety profile over a 12-month evaluation period.
- Additionally, no subject in the exchange trial exhibited a greater than 30% endothelial cell loss over the extended evaluation period of more than five years on average.
- Glaukos plans to include the exchange trial's positive data set in its upcoming U.S. Food and Drug Administration (FDA) New Drug Application (NDA) submission targeted for the first quarter of 2023.

Cannabinoids

Marijuana & Glaucoma

TABLE 1. MARIJUANA SIDE EFFECTS*[5,14]

OCULAR	SYSTEMIC
• Conjunctival hyperemia	• Tachycardia
• Decreased lacrimation	• Decreased blood pressure
• Photophobia	• Orthostatic hypotension
• Ptosis	• Euphoria or dysphoria
• Blepharospasm	• Impaired coordination
• Nystagmus	• Difficulty with concentration, problem solving, memory
• Impairment of accommodation	• Decreased testosterone
	• Impaired immunity

**Any route of administration*

Marijuana & Glaucoma Therapy

American Glaucoma Society:

“Although marijuana can lower the intraocular pressure, its side effects and short duration of action, coupled with a lack of evidence that its use alters the course of glaucoma, preclude recommending this drug in any form for the treatment of glaucoma at the present time.”

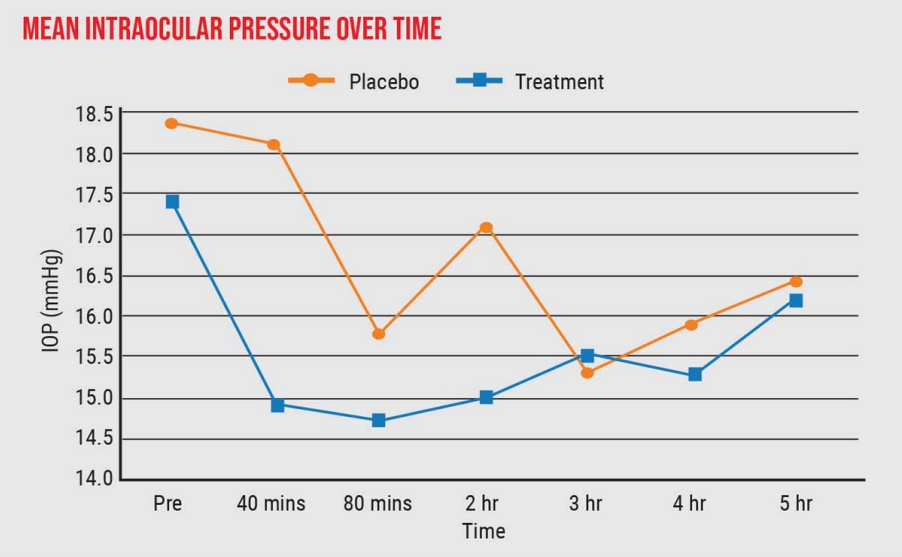
Cannabis, Glaucoma and Intraocular Pressure

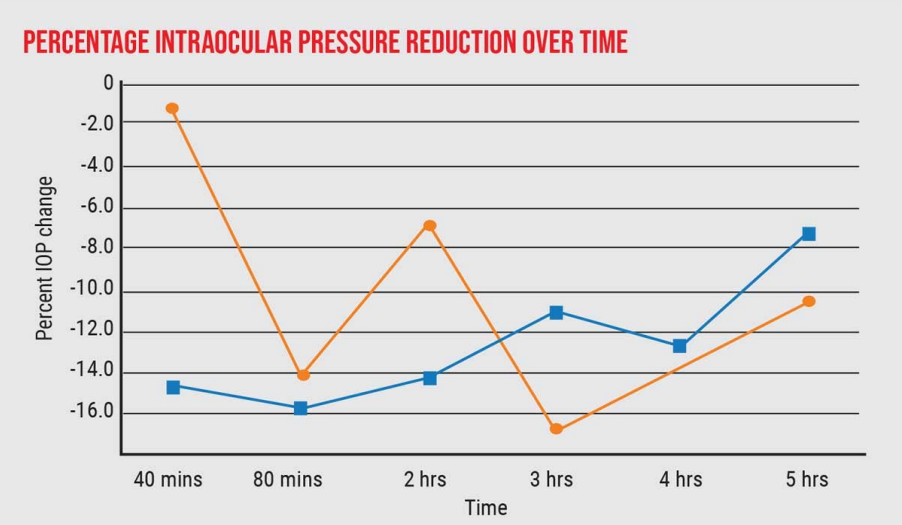
- Because of the Schedule I status and the stigma associated with it, all research on cannabis basically ceased in the 1980s; it was just too difficult to get around the regulations.
- Among other things, limited high-quality data has impacted the current American Academy of Ophthalmology and American Glaucoma Society positions on the use of cannabis to treat glaucoma.
- They don't support it, largely because there's too little information to justify such support.
- Sameh Mosaed, Etal (Review of Ophthalmology 2022)

Cannabis, Glaucoma and Intraocular Pressure

Sameh Mosaed, MD / Review of Ophthalmology

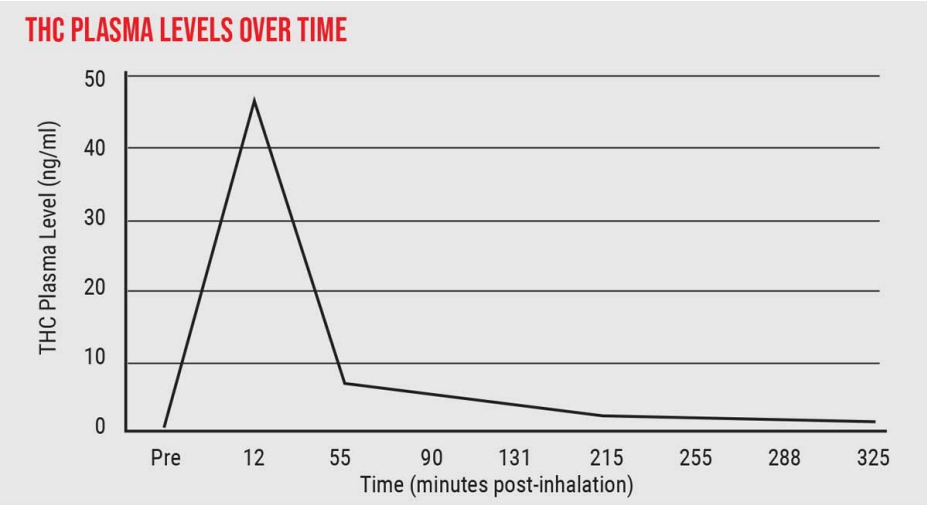
Dr. Mosaed is a professor of ophthalmology and director of the Glaucoma Division of the Gavin Herbert Eye Institute at UC Irvine.
.Dr. Singh is a professor of ophthalmology and chief of the Glaucoma Division at Stanford University School of Medicine.
Dr. Netland is Vernah Scott Moyston Professor and Chair at the University of Virginia in Charlottesville.

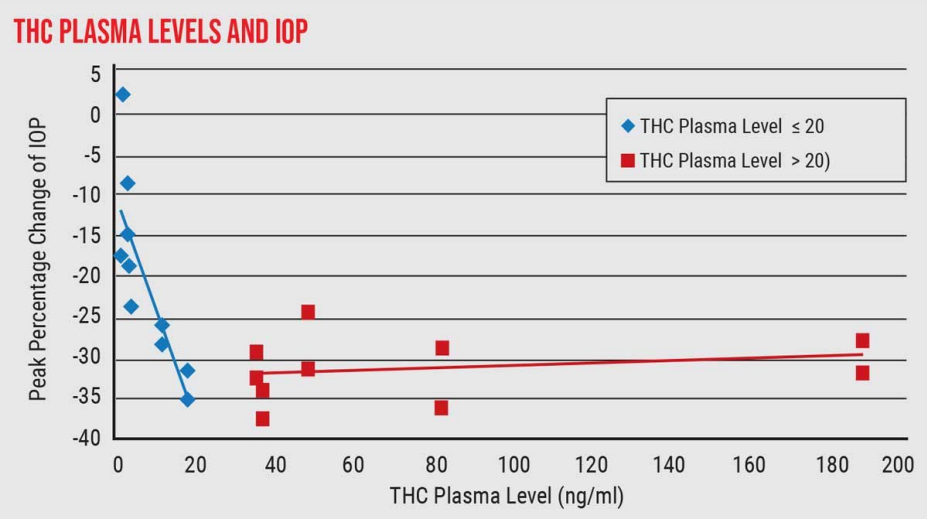




One of the author's studies found a substantial and significant decrease in IOP in subjects smoking cigarettes with THC, compared to placebo. The patients went from a mean IOP of 17.5 mmHg prior to smoking down to lower than 15 mmHg, 15 percent below baseline.

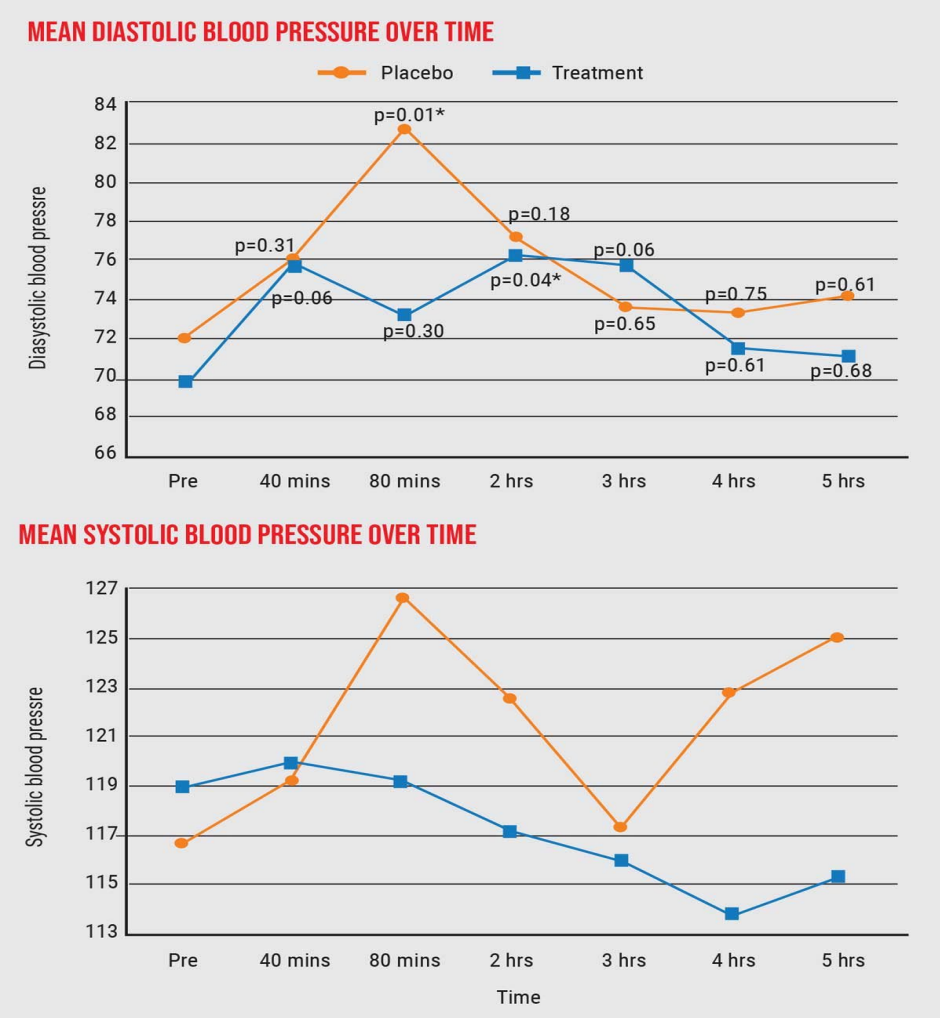
Cannibis, Glaucoma and Intraocular Pressure





THC is metabolized quickly, soon disappearing from the bloodstream. (Top graph) Decline in IOP paralleled rising THC plasma levels up to 20 ng/ml; above that, IOP did not decline. (Bottom graph) This suggests that a limited intake of THC—possibly a small enough amount to avoid psychotropic effects—could accomplish significant IOP lowering

Cannabis, Glaucoma & Intraocular Pressure



The data revealed only one point of statistically significant difference between the placebo group and cannabis group in diastolic or systolic blood pressure (asterisk).

Cannabis, Glaucoma and Intraocular Pressure

- Many people talk about marijuana when they really should be discussing *cannabis*.
- Cannabis is a genus of flowering plants in the *Cannabaceae* family, which consists of three primary species: *Cannabis sativa*; *Cannabis indica*; and *Cannabis ruderalis*.
- The term marijuana has negative connotations; it's used to refer to specific varieties of cannabis that contain more than 0.3 percent THC. CBD, on the other hand, has no psychotropic effects.
- Cannabis contains multiple compounds—more than 480, of which about 65 have been identified as phytocannabinoids (including CBD and THC).
- Cannabis also contains about 120 compounds that give it its characteristic aroma—mainly volatile terpenes and sesquiterpenes. Not surprisingly, most patients don't know much about cannabis; many don't even understand the distinction between THC and CBD.

Cannabis, Glaucoma & Intraocular Pressure

- We found a substantial and significant decrease in IOP in subjects smoking cigarettes with THC compared to placebo. The patients went from an average IOP of 17.5 mmHg prior to smoking, down to lower than 15 mmHg, 15 percent lower than baseline.
- A 15-percent reduction, when you start out with normal pressure, is quite significant—on a par with what you'd see with a single-agent IOP-lowering eye drop.
- The lower pressure was sustained for up to three hours.
- In terms of systolic and diastolic blood pressure, we found no statistically significant differences between the placebo group and cannabis group. There were some differences, as the graphs show *(graph below)*, but the differences were only statistically significant at a single time point (marked with an asterisk).
- We confirmed that THC is metabolized very quickly; it gets absorbed into tissues and disappears from the bloodstream very quickly.
- There was a linear correlation between THC level in the blood plasma and IOP reduction, up to about 20 ng/ml of THC. Additional elevation of plasma THC, however, didn't correlate with further IOP lowering. *(See graph above.)* In other words, achieving 20 ng/ml of blood plasma level of THC was all that was required to achieve the maximum IOP-lowering effect.

Mechanisms of Cannabis in Glaucoma (GT 4/18)

- Marijuana and THC have been shown to lower IOP in 60% to 65% of both normal individuals and patients with glaucoma. Mean IOP reduction in one study was about 25%.[5]
- An ocular hypotensive effect has been reported when the drug is smoked or ingested and when THC is inhaled or administered orally, sublingually, or intravenously.[6]
- The duration of action is short, about 3 to 4 hours.
- There appears to be a dose-response relationship between the amount of marijuana consumed and the degree of IOP reduction, although the length of efficacy does not improve at higher doses.[5]
- Topical administration of THC to the eye does not lower IOP.[7,8]
- THC is a highly lipophilic compound and cannot be administered in a water-based vehicle.
- In one placebo-controlled double-masked study using an oil-based vehicle, no IOP-lowering effect was demonstrated. Both the placebo (vehicle) and the study drug caused significant ocular irritation.[7]

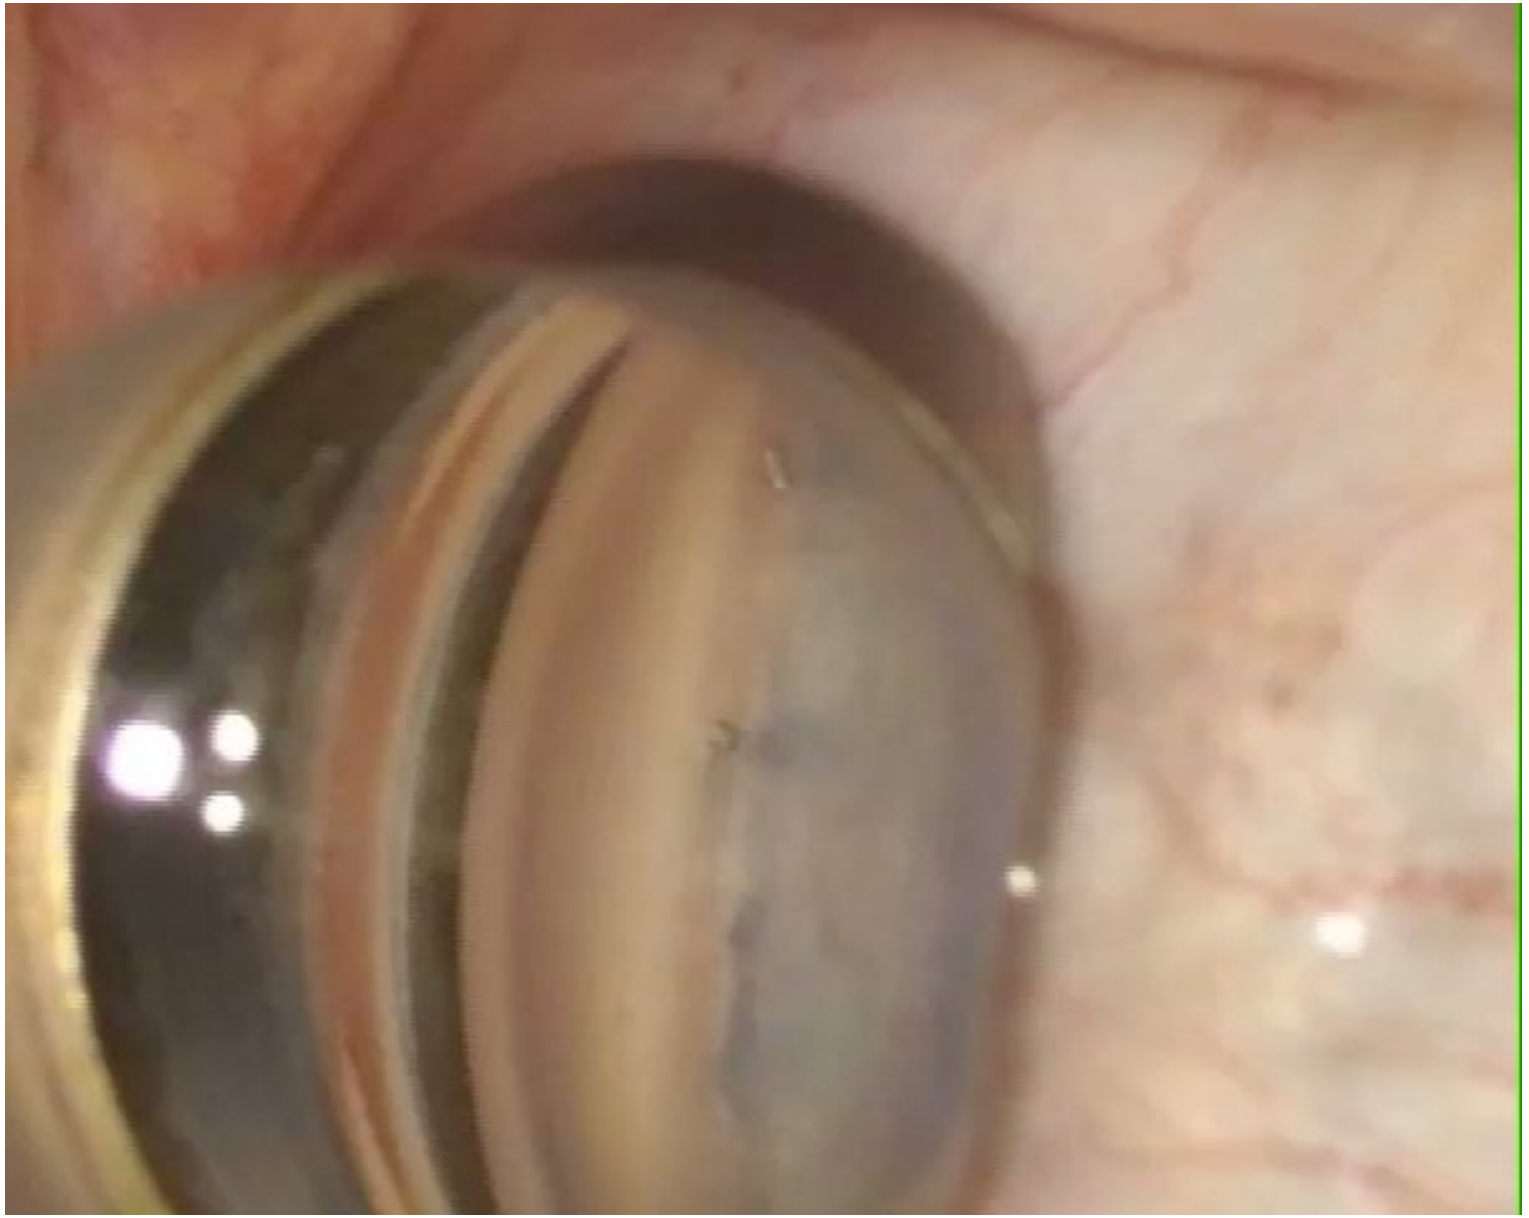
Case Report

- 75 year old female with modérate POAG but with some angle narrowing
- Treated with latanoprost and timolol/brimonidine
- IOP 20/21 Peak IOPs 26/27
- Inferior thinning of RNFL on OCT, with VF nasal steps
- Visual acuity 20/50 OU due to modérate NS cataracts
- Treated with combined OMNI/cataract OU
- Several days of post-op microhyphema
- IOP 18/19 on no meds post-op

Ab interno Viscocanalostomy



Ivantis /Hydrus Microstent

- The FDA's approval was based on the 24-month results from the HORIZON trial, the largest MIGS study to date.
- The study included 556 mild to moderate glaucoma patients randomly assigned to undergo cataract surgery with or without the microstent.
- More than 77% of patients with the implant exhibited a significant decline in unmedicated IOP, compared with 58% of the control group.
- On average, the device reduced IOP by 7.5 mmHg, approximately 2.3 mmHg more than the cataract surgery-only group.

Hydrus™ Aqueous Implant

- **Flexible canal “scaffold”**
- Composed of biocompatible alloy (Nitinol)
- Scalloped and open design allows aqueous flow

OCT Artifacts Common With Combined Glaucoma, High Myopia

K. Patricia Bouweraerts, MA | December 13, 2023

Optical coherence tomography (OCT) artifacts are common among patients with both high myopia and glaucoma, according to the findings of a study published in the *Journal of Glaucoma*.

Small Optic Discs, Asian Ethnicity Raise Glaucoma Progression Risk

Lisa Kuhns, PhD | January 4, 2024

Individuals of Asian ethnicity who have small optic discs have increased odds of glaucomatous progression compared with those with White ethnicities who have equally small discs, according to a study published in *Ophthalmology Glaucoma*. The research also shows that patients with small discs who have an increased range or an increased peak of intraocular pressure (IOP) have a greater incidence of progression, and that IOP peak is also associated with increased risk in patients with large optic discs.

OCT Artifacts Common With Combined Glaucoma, High Myopia

K. Patricia Bouweraerts, MA | December 13, 2023

Optical coherence tomography (OCT) artifacts are common among patients with both high myopia and glaucoma, according to the findings of a study published in the *Journal of Glaucoma*.

2.1 ↔ -11.1	-0.14 ↔ 0.80	56 ↔ 100	0.09 ↔ -12.2	0.86 ↔ 1.41
-6.4 (84%)	0.34 (73%)	78 (67%)	-7.1 (82%)	0.95 (20%)

PhNR at 72 ms		PhNR at minimum		
µV	P-ratio[1]	ms	µV	W-ratio[1]
2.1 ↔ -11.1	-0.14 ↔ 0.80	56 ↔ 100	0.09 ↔ -12.2	0.86 ↔ 1.41
-5.6 (75%)	0.31 (67%)	79 (73%)	-6.7 (79%)	1.03 (40%)

[1]P-ratio = $-p_{72}/b$ as described in Preiser (2013)
W-ratio = $(b - p_{min}) / (b - a)$ which is the reciprocal of "PTR" as described in Mortlock (2010)
where a, b, p_{72}, and p_{min} are the voltages relative to baseline defined as
a: a-wave peak, b: b-wave peak, p_{72}: voltage at 72 ms, and p_{min}: the minimum of the PhNR wave.

- The PhNR reflects generalized activity of retinal ganglion cells and their axons
- Amplitude can be reduced early in diseases that affect the innermost retina, like glaucoma

DR Assessment

Components of the RET*eval* Diabetic Retinopathy Assessment: Biostatistician – Bascom Palmer

DR assessment protocol combines:

implicit time (ERG)

How long it takes the retina to respond

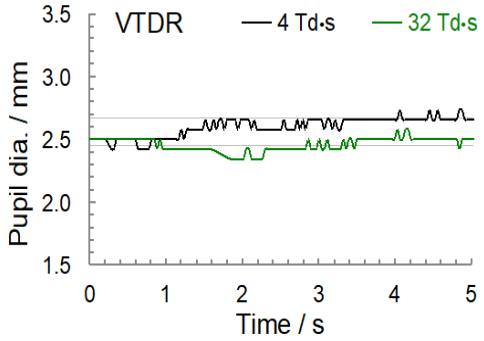
amplitude (ERG)

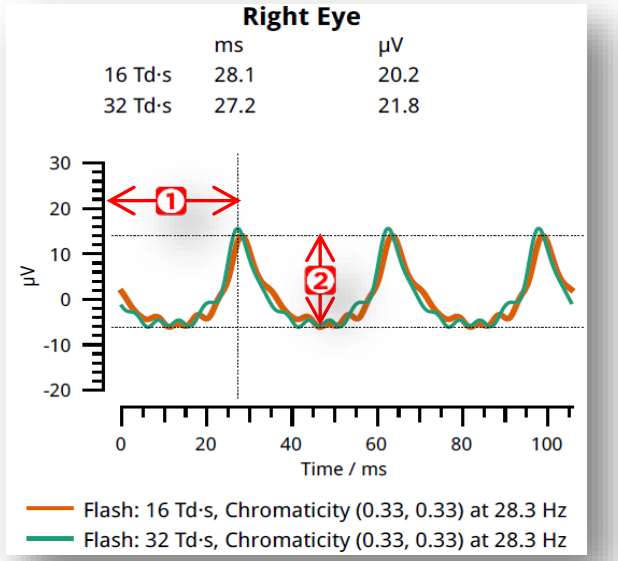
How strong the signal from the retina is

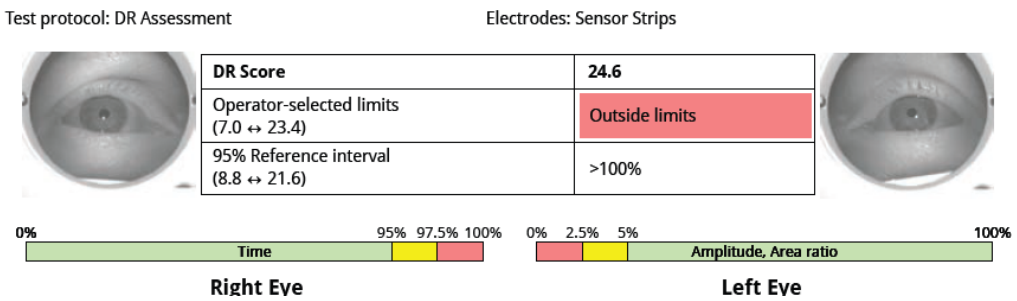
pupil response

Change in pupil diameter–dim vs. bright

patient age



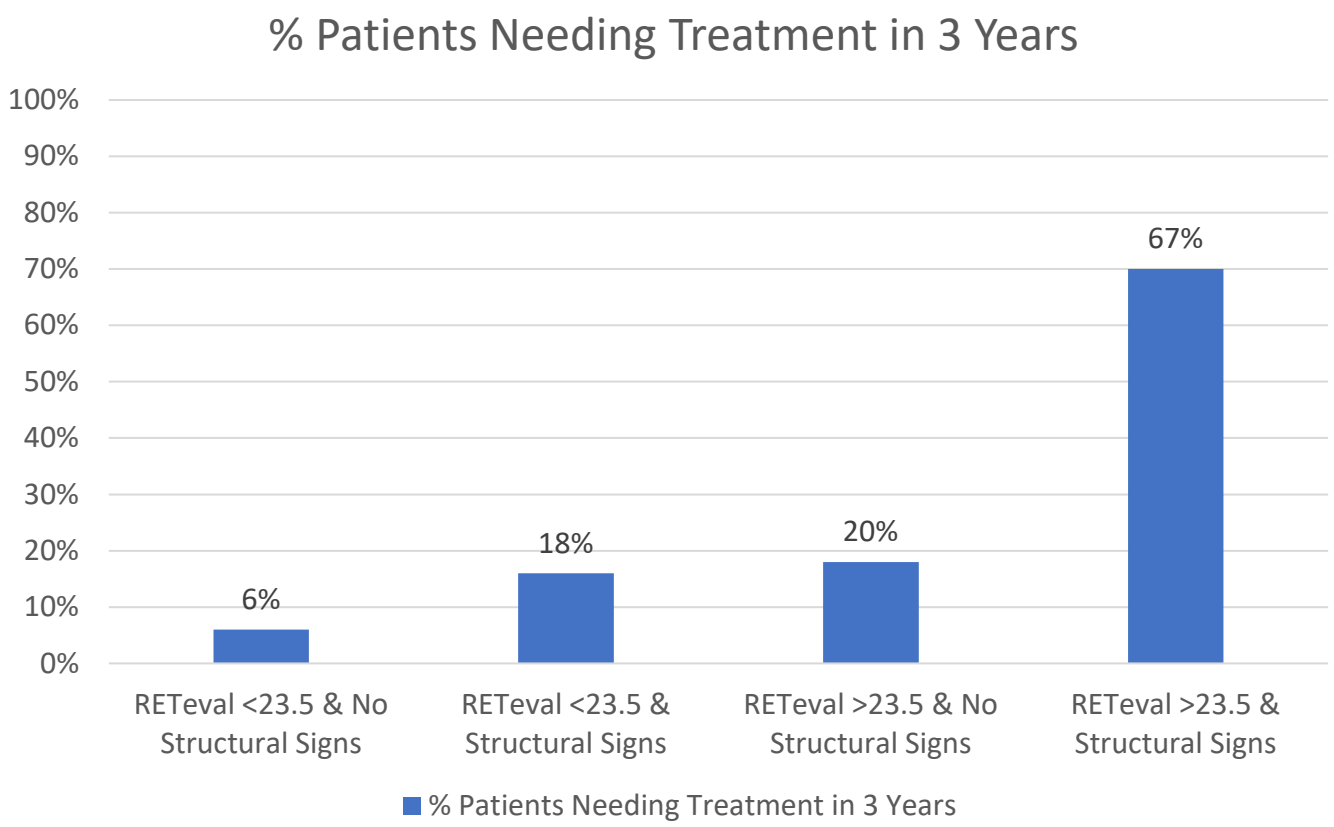




Diabetic Retinopathy

Longitudinal Study Shows Ability of the RET*eval* to Predict Progression

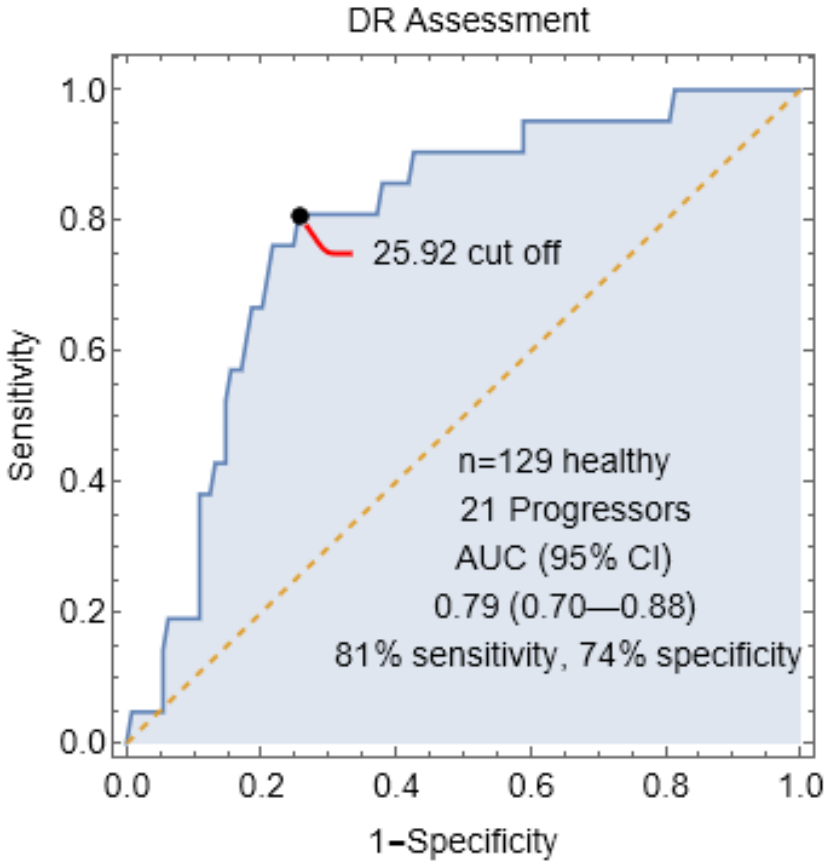
- Longitudinal study with 279 patients
- Conducted in USA
- Primary outcome: treatment conducted in follow up period
- Structure & RET*eval* function were measured to predict progression
- In general: 17% of DR progresses to treatment

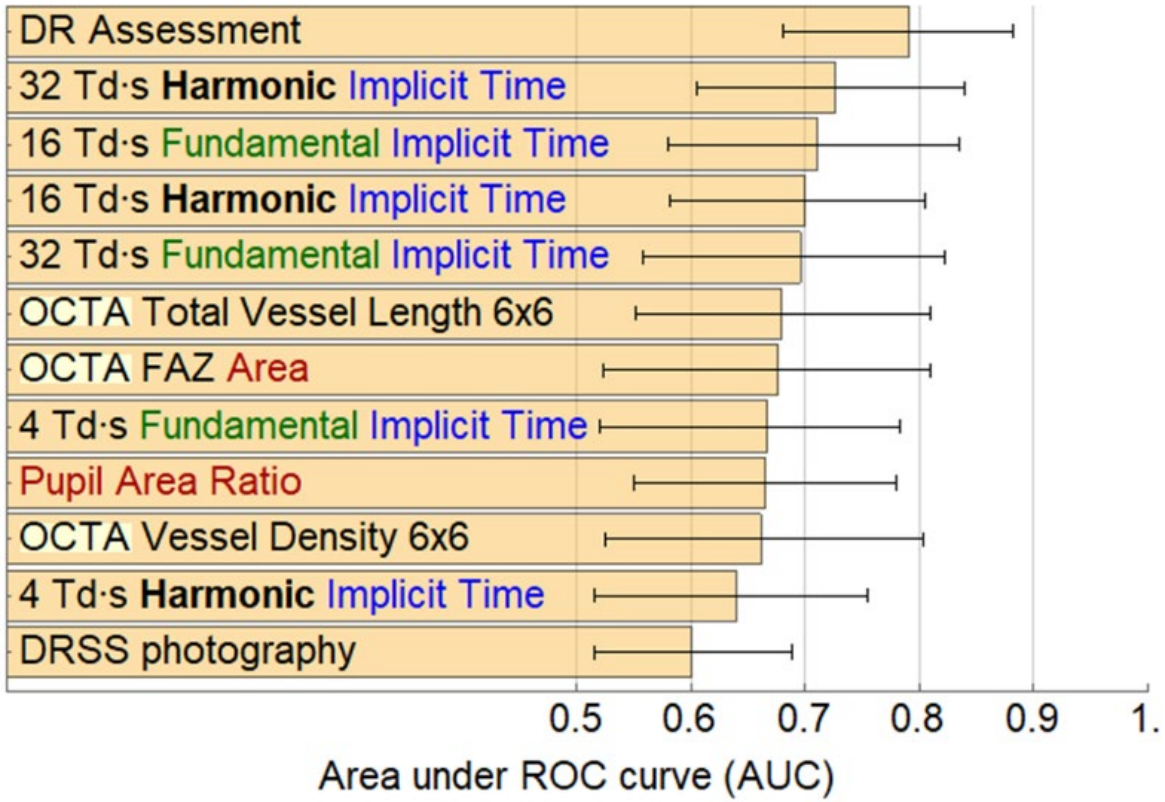


Brigell MG, Chiang B, Maa AY, Davis CQ. Enhancing Risk Assessment in Patients with Diabetic Retinopathy by Combining Measures of Retinal Function and Structure. *Trans Vis Sci Tech*. 2020;9(9):40-40.

Diabetic Retinopathy

The Predictive Ability of the RETeval Device was Shown to be More Sensitive than Imaging Technologies when Evaluating Patients Needing Treatment in the Next 12 Months





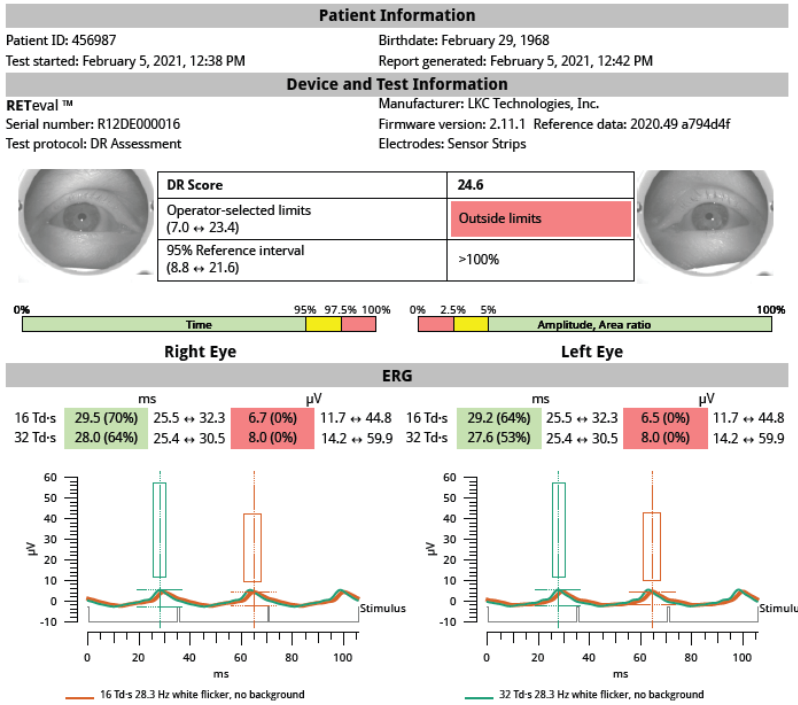
Diabetic Retinopathy

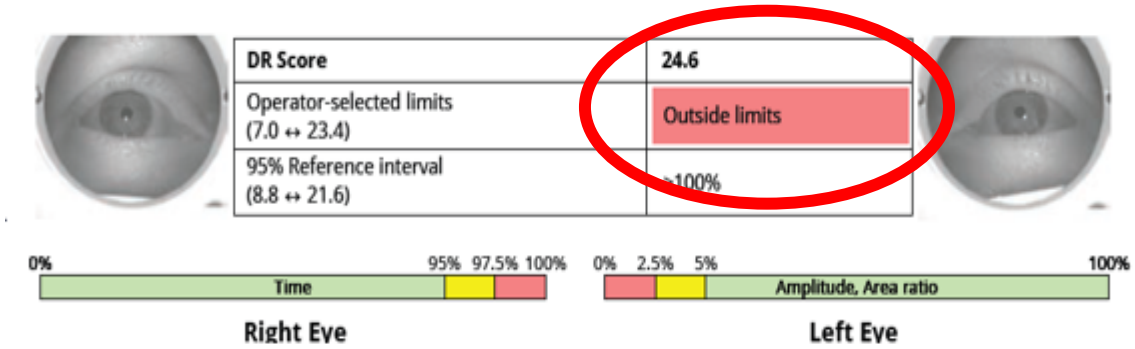
How to Use the DR Score in Practice → Interpretation Guide

Patient test conditions: Test is done always un-dilated. Patient is diabetic with suspected retinopathy or diabetic with existing retinopathy.

Protocol: DR Assessment

Results: If the **Operator Selected limit** is marked red with text Outside Limits, the patient is at the risk to develop vision threatening DR within the coming 36 months.





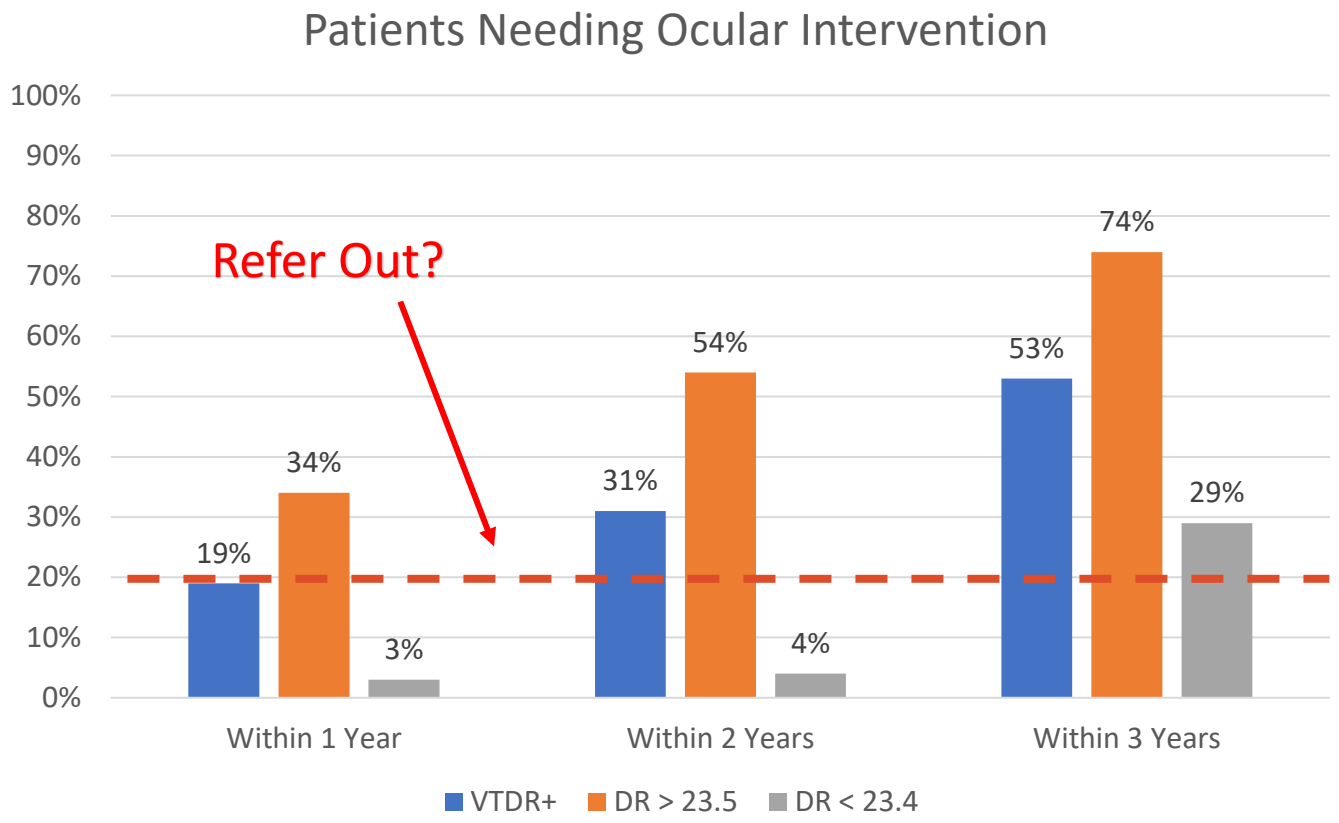
Predicting progression of Diabetic Retinopathy

- **Score <23.5** → Patient is much less likely to progress to needing treatment in the next few years
- **Score >23.5** → high chance of requiring treatment in next 3 years
- **Score >26.0** → predictive of needing treatment in 1 year

Diabetic Retinopathy

Combining Diabetic Structure and Function Gives Us a More Complete Picture for Clinical Decisions

- VTDR+ = positive vision threatening diabetic retinopathy
- VTDR+
- Severe NPDR
- Proliferative DR
- ME
- Would you refer this patient out based on the structural findings?
- Adding in the functional data gives you a more complete picture
- Does this information change your protocols?



Brigell MG, Chiang B, Maa AY, Davis CQ. Enhancing Risk Assessment in Patients with Diabetic Retinopathy by Combining Measures of Retinal Function and Structure. *Trans Vis Sci Tech*. 2020;9(9):40-40.

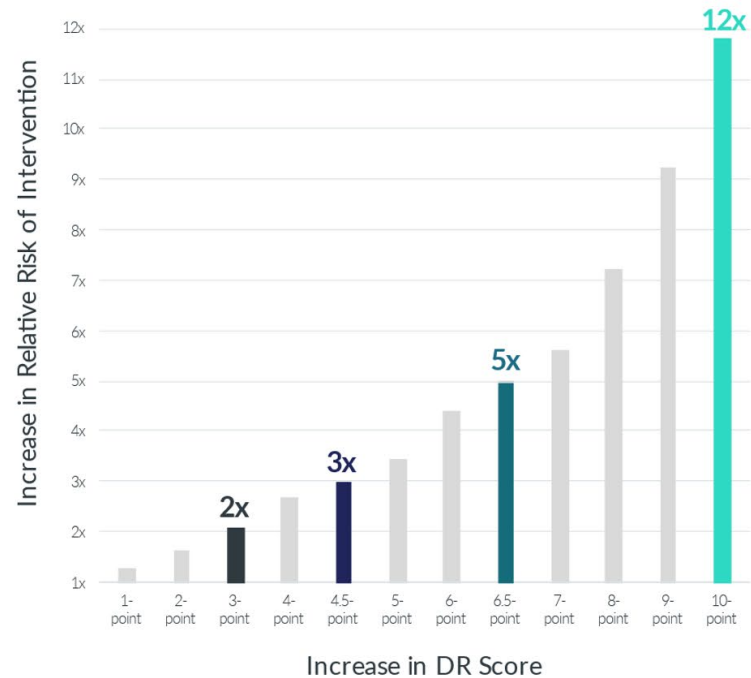
DIABETIC RETINOPATHY

Why the DR Score matters

Each 1-point change in the DR Score increases the probability of ocular intervention over 3 years by 28%

Higher DR Score & change over time dramatically increases risk:

- Risk of intervention **doubles** with a 3-point increase in DR Score (e.g. 20 to 23)
- Risk of intervention **triples** with a 4.5-point increase in DR Score (e.g. 20 to 24.5)
- Risk of intervention **increases 5x** with a 6.5-point increase in DR Score (e.g. 20 to 26.5)
- Risk of intervention **increases 12x** with a 10-point increase in DR Score (e.g. 16 to 26)



Cox proportional hazards analysis (CI = 1.171.40, p < 0.0001)

- 2001 Nakayama et al.
- 2013 Ortube et al.

Longitudinal study: RET*eval* vs. 7-field photographs

3 YEAR RESULTS

- For patients with VTDR+ the incidence of intervention was 19%, 31%, and 53% after 1, 2, and 3 years of follow-up.
  - In these patients, **intervention incidence increased to 34%, 54%, and 74% the subsequent 1, 2, and 3 years if function was above criterion (RETeval+)**
  - RETeval– results reduced the risk to 3%, 4%, and 29%, respectively, reducing risk to similar levels seen for patients with VTDR– results at baseline.

Brigell et al. (2020) Enhancing Risk Assessment in Patients with Diabetic Retinopathy by Combining Measures of Retinal Function and Structure, TVST

Longitudinal study: RET*eval* vs. 7-field photographs

- At baseline, record **RET***eval* DR Assessment test and ETDRS 7-field stereo dilated photographs.
- Wait 3+ years
- Chart review for which subjects had a relevant ocular intervention
  - Anti-VEGF injections
  - Laser
  - Vitrectomy
- Analyze using Kaplan-Meier and relative risks to compare predictive capabilities of **RET***eval* DR Score vs photography

Brigell et al. (2020) Enhancing Risk Assessment in Patients with Diabetic Retinopathy by Combining Measures of Retinal Function and Structure, TVST

Components of the RET*eval* DR Score

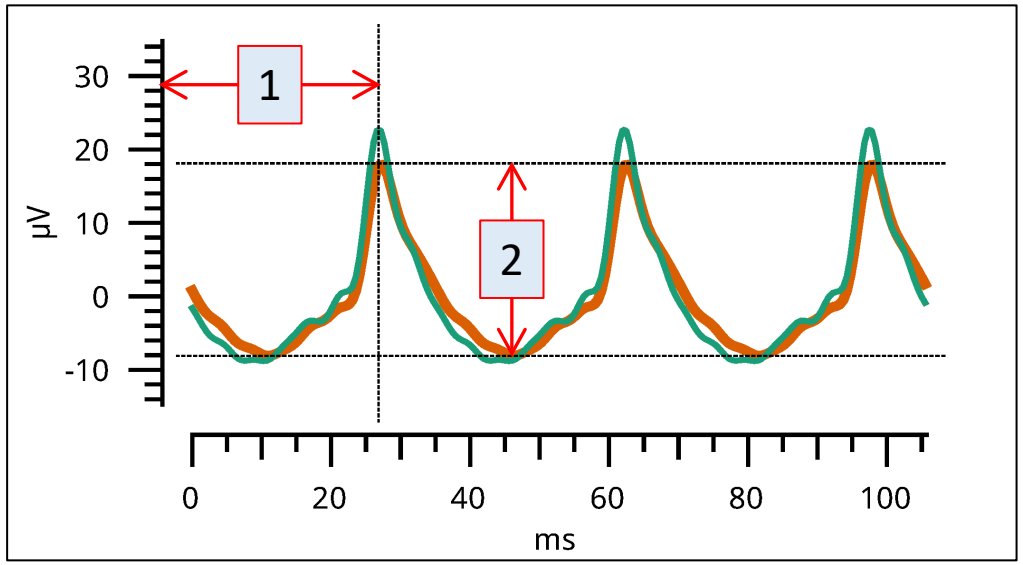
DR Score combines

1. The shorter implicit time between the two eyes
   (How long it takes the retina to respond)

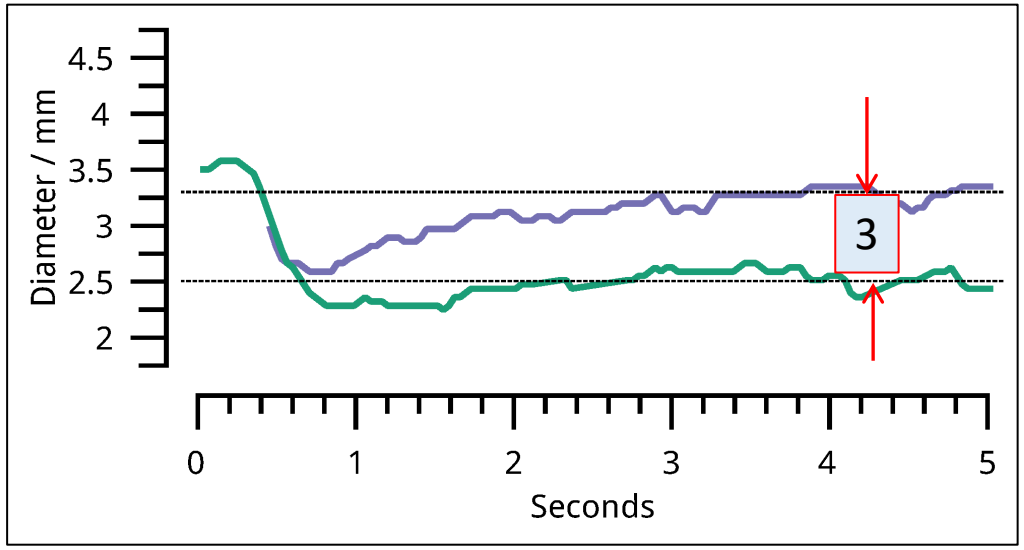
2. The larger amplitude of the two eyes
   (How strong the signal is from the retina)

3. Worst pupil response of the two eyes
   (Change in pupil area from dim to bright light)

4. Age



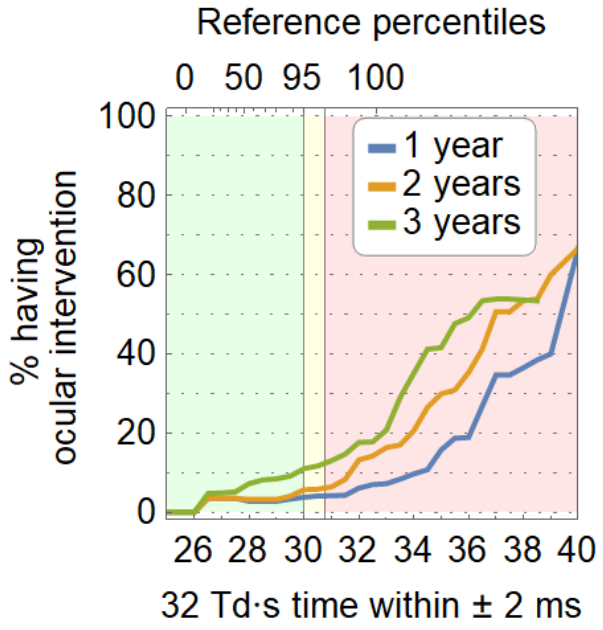
ERG

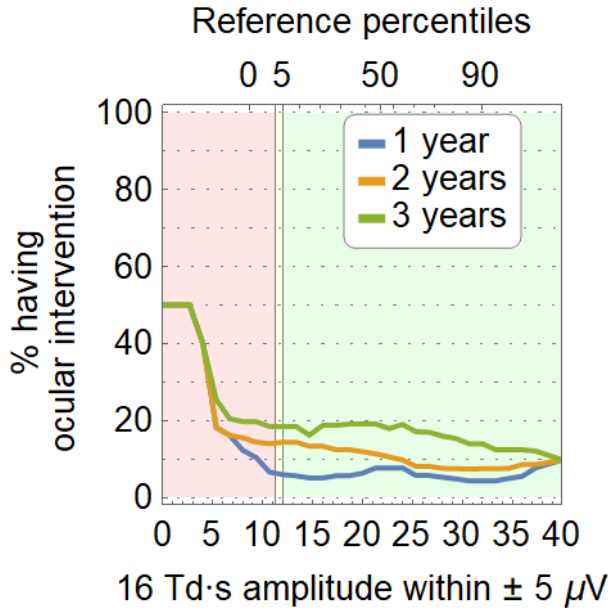


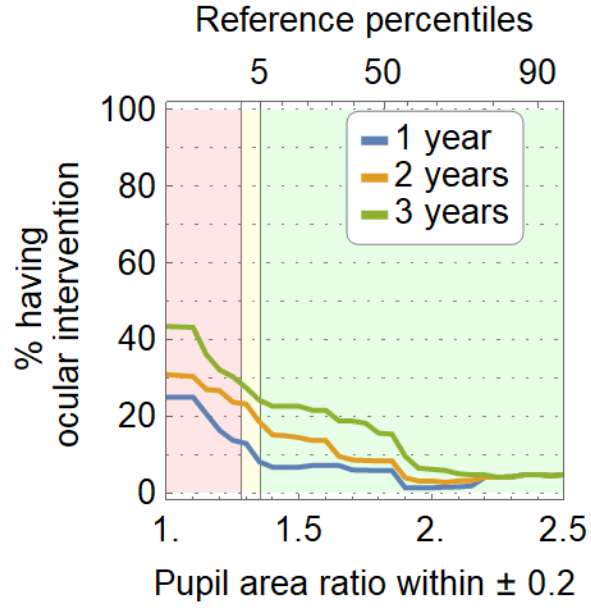
Pupil response

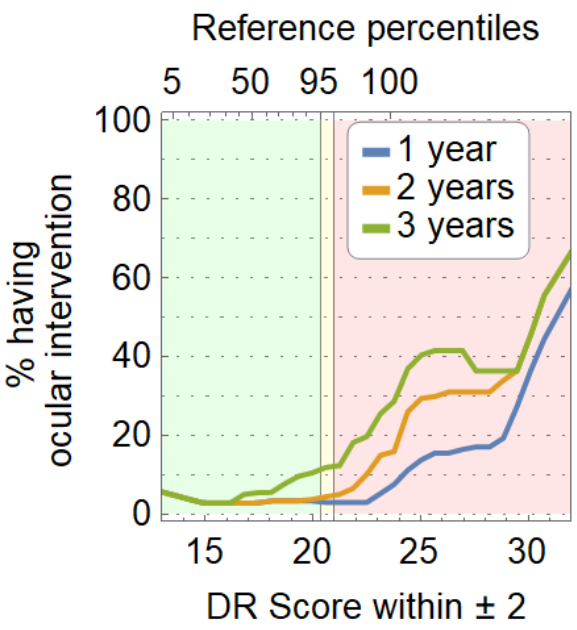
Who is at Risk for an Ocular Intervention within 3 Years?

- Long ERG times
- Small ERG amplitudes
- Small pupil responses
- **Large DR Scores predict disease!!!**



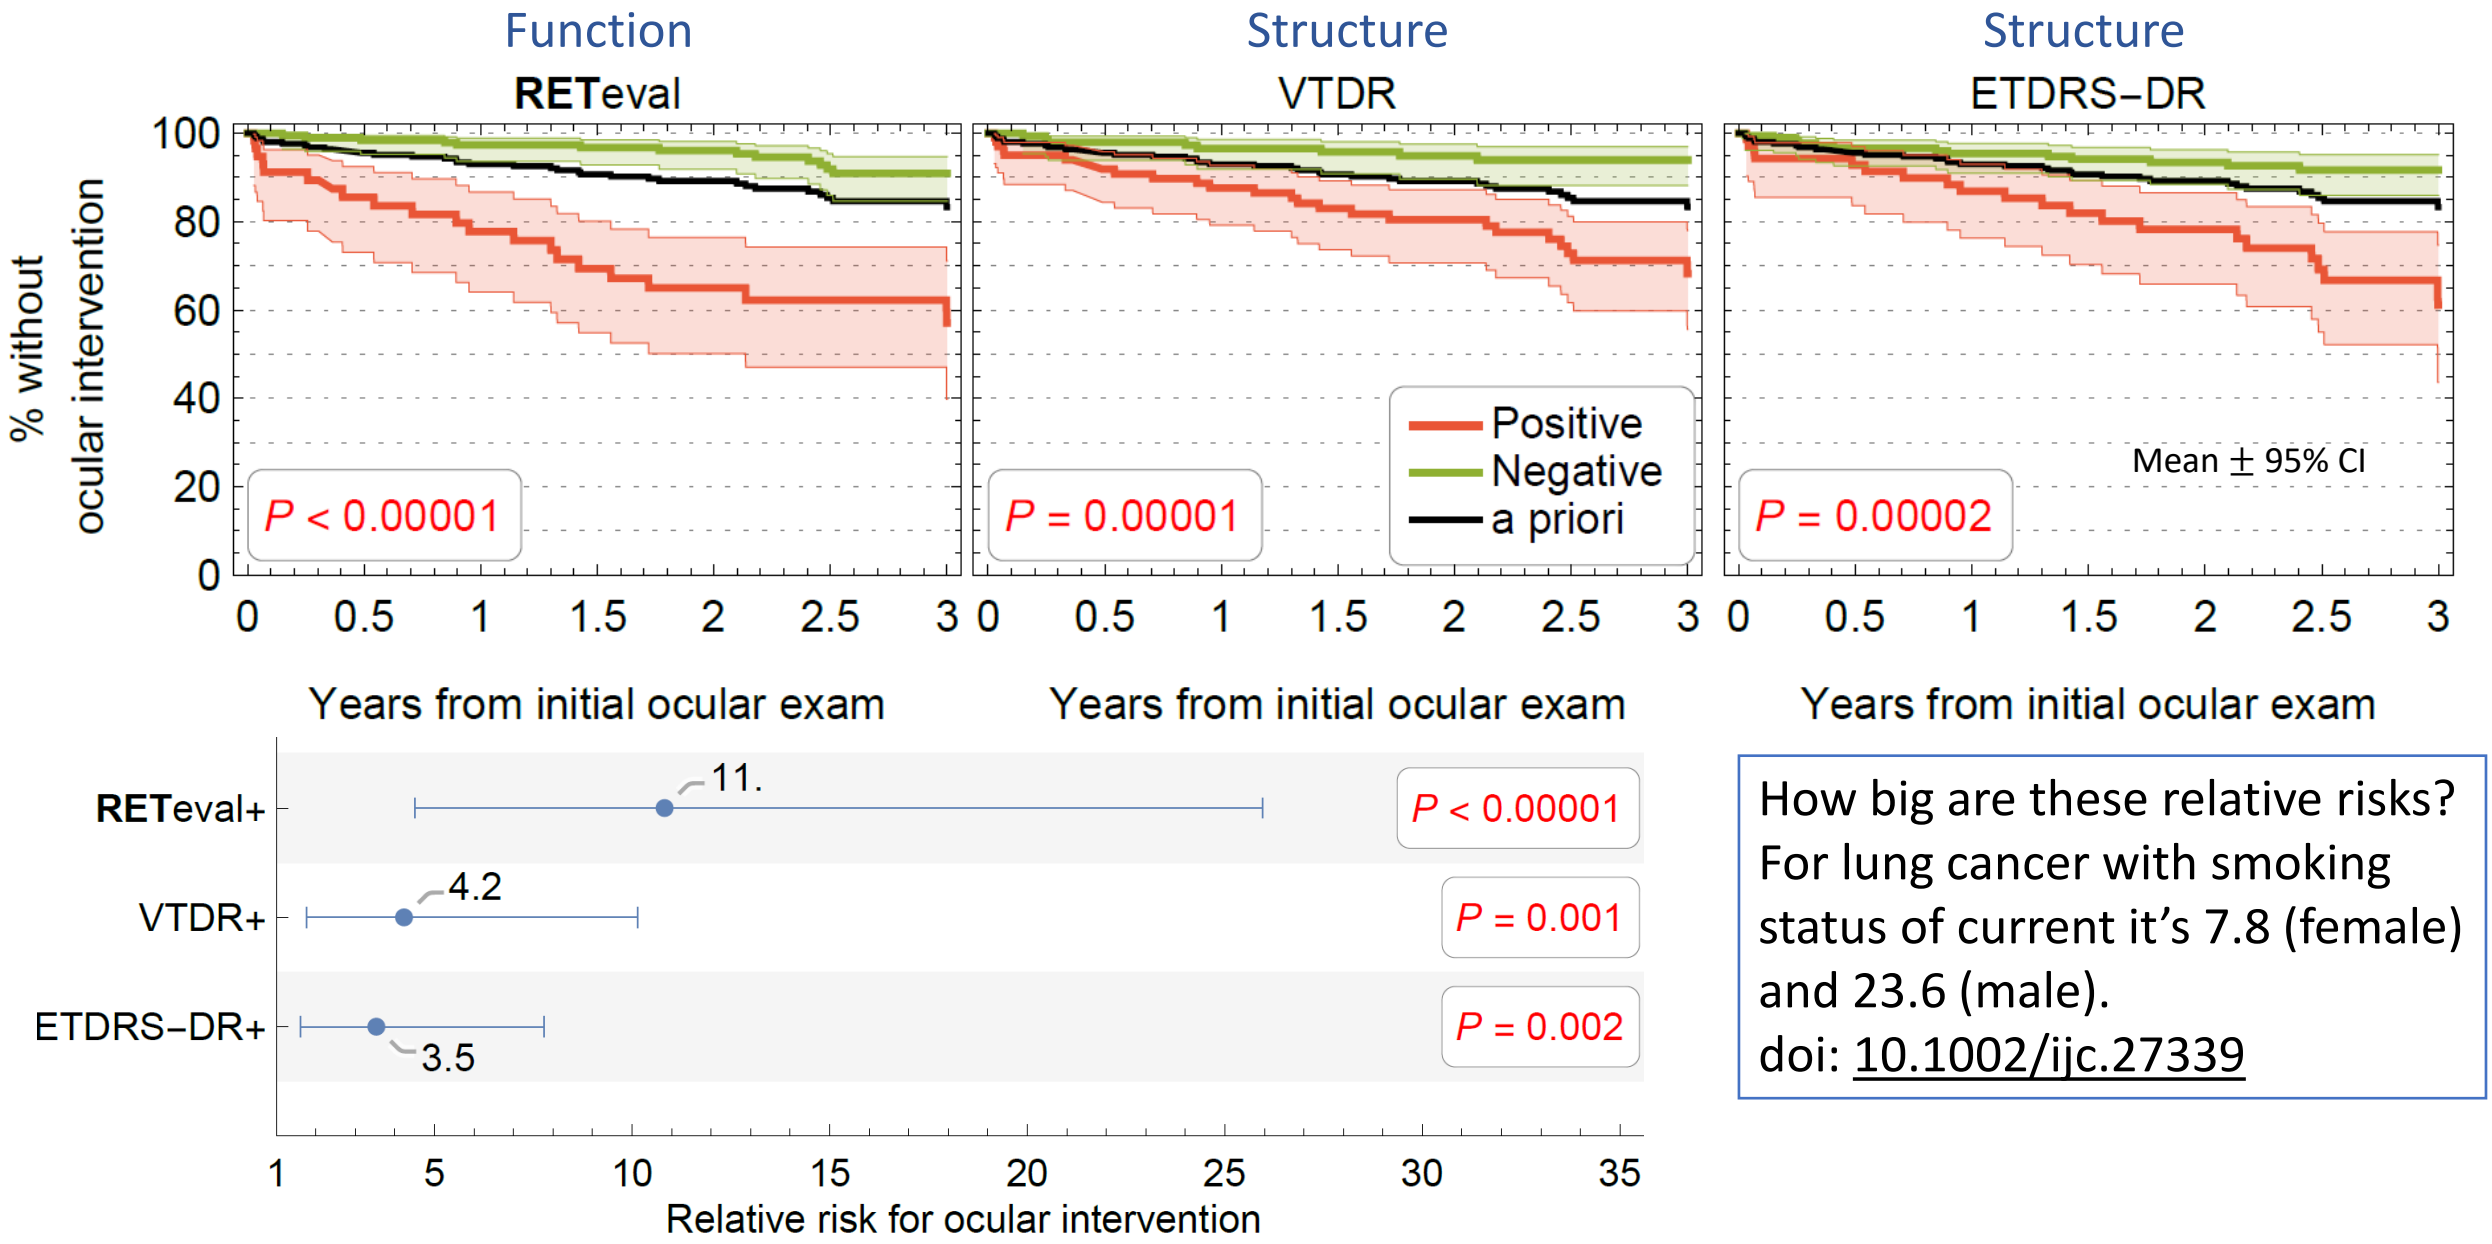






Brigell et al. (2020)

Longitudinal study: RET*eval* (function) vs. 7-field photo (structure)



How big are these relative risks? For lung cancer with smoking status of current it's 7.8 (female) and 23.6 (male).
doi: 10.1002/ijc.27339

Brigell et al. (2020) Enhancing Risk Assessment in Patients with Diabetic Retinopathy by Combining Measures of Retinal Function and Structure, TVST

How to set the DR decision limits

Study	Gold standard	Upper clinical decision limit (largest value considered normal)
Maa et al. (2016)	7-field stereo ETDRS photographs on dilated eyes, cross-sectional study	19.9
Degirmenci et al. (2018)	Slit-lamp biomicroscopy and dilated fundus examination by indirect ophthalmoscopy, cross-sectional study	21.9
Zeng et al. (2019)	Slit-lamp biomicroscopy, 7-field stereo ETDRS photographs on dilated eyes, and OCT, cross-sectional study	23.0
Brigell et al. (2020)	Surgical interventions (laser, injections, or vitrectomy) over the subsequent 3 years, longitudinal study	23.4

I recommend 23.4, because I put more weight on longitudinal trials – results are generally more obvious with time. Instead of comparing to a different method of predicting who will have issues, just wait and see.

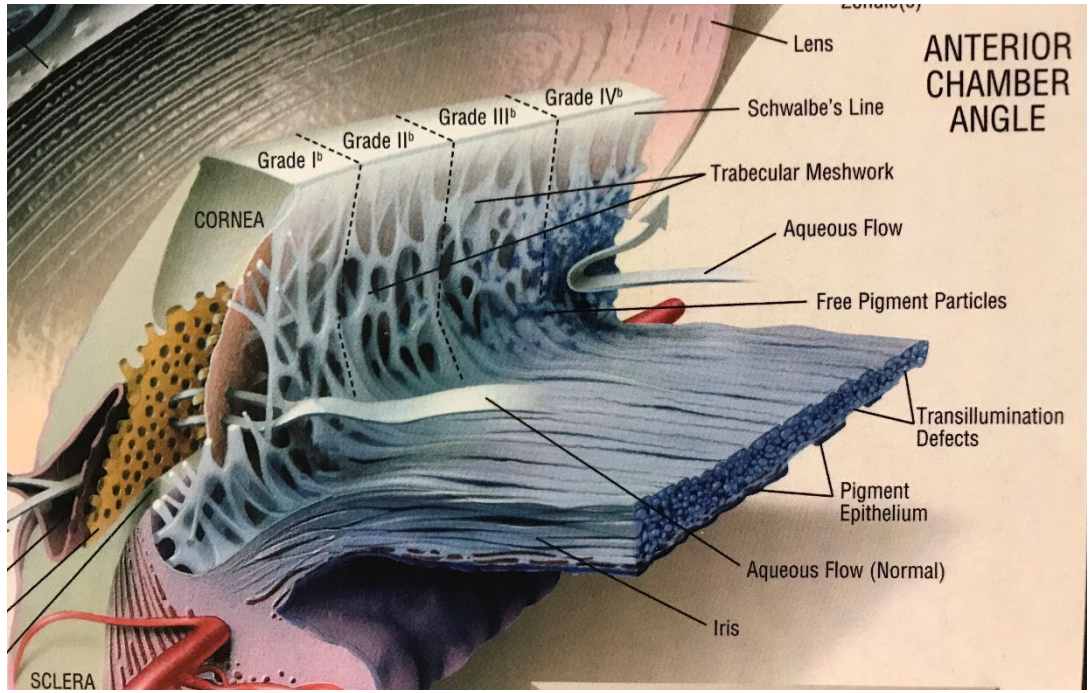
Beyond IOP, Managing Aqueous Outflow

Tonography

Setting a Target Outflow Facility Value

Aqueous Humor Dynamics

Aqueous Humor Outflow Pathway



Is Measuring IOP Alone Enough?

- Does Not Validate Therapeutic Response
- Does Not Predict Risk
- Only Valid if You Obtain Multiple Measurements Over 24 Hours
- Patients with Untreated Glaucoma Can Have Normal IOP

Reference: Baltimore Eye Survey, Johns Hopkins University Study

Aqueous Humor Dynamics

- IOP is directly related to aqueous humor production and inversely related to aqueous humor outflow.
- The rate of aqueous humor production is not constant.
- The rate of aqueous humor outflow is constant.
- IOP varies throughout the day.
- The variability of aqueous humor production is the source of IOP variation.
- Using IOP alone can lead to the incorrect conclusion.
- Eyes with untreated glaucoma may have normal IOP when evaluated.
-

Why Measure Outflow Facility?

- Impaired Outflow Facility is the Primary Cause of Glaucoma
- Outflow Facility Measurements Predict IOP In and Out of the Office

OPHTHALMOLOGY VOLUME 127, ISSUE 4

Measuring Glaucomatous Focal Perfusion Loss in the Peripapillary Retina Using OCT Angiography

David Huang, MD et al

.

Participants

A total of 47 patients with primary open-angle glaucoma (POAG) and 36 normal participants were analyzed.

Methods

One eye of each subject was scanned using an AngioVue (Optovue, Fremont, CA) 4.5-mm OCTA scan centered on the disc.

En face nerve fiber layer (NFL) plexus angiogram was generated. With the use of custom software, a capillary density map was obtained by computing the fraction of area occupied by flow pixels after low-pass filtering by local averaging 21×21 pixels.

The low-perfusion map is defined by local capillary density below 0.5 percentile over a contiguous area above 98.5 percentile of the normal reference population. The LPA parameter is the cumulative area, and the FPL is the percent capillary density loss (relative to normal mean) integrated over the LPA.

Measuring Glaucomatous Focal Perfusion Loss in the Peripapillary Retina Using OCT Angiography

David Huang, MD et al

- Main Outcome Measures
- Peripapillary retinal LPA and FPL.
- Results
- Among patients with POAG, 3 had preperimetric glaucoma and 44 had perimetric glaucoma, with visual field (VF) mean deviation (MD) of −5.14±4.25 decibels (dB). The LPA was 3.40±2.29 mm^2 in those with POAG and 0.11±0.18 mm^2 in normal subjects ($P < 0.001$). The FPL was 21.8%±17.0% in those with POAG and 0.3%±0.7% in normal subjects ($P < 0.001$).
- The diagnostic accuracy as measured by the area under the receiver operating curve was 0.965 for both LPA and FPL, with a sensitivity of 93.7% at 95% specificity. The repeatability as measured by intraclass correlation coefficient was 0.977 for LPA and 0.958 for FPL.
- The FPL had excellent correlation with VF MD (Spearman's rho = −0.843), which was significantly ($P = 0.008$) better than the correlation between NFL thickness and VF MD (rho = 0.760). The hemispheric difference correlation between FPL and VF (Spearman's rho = 0.770) was significantly ($P < 0.001$) higher than the hemispheric difference correlation between LPA and VF (rho = 0.595).

Measuring Glaucomatous Focal Perfusion Loss in the Peripapillary Retina Using OCT Angiography
David Huang, MD et al

- Conclusions
- The low-perfusion map and LPA and FPL parameters are able to assess the location and severity of focal glaucoma damage with good agreement with VF.

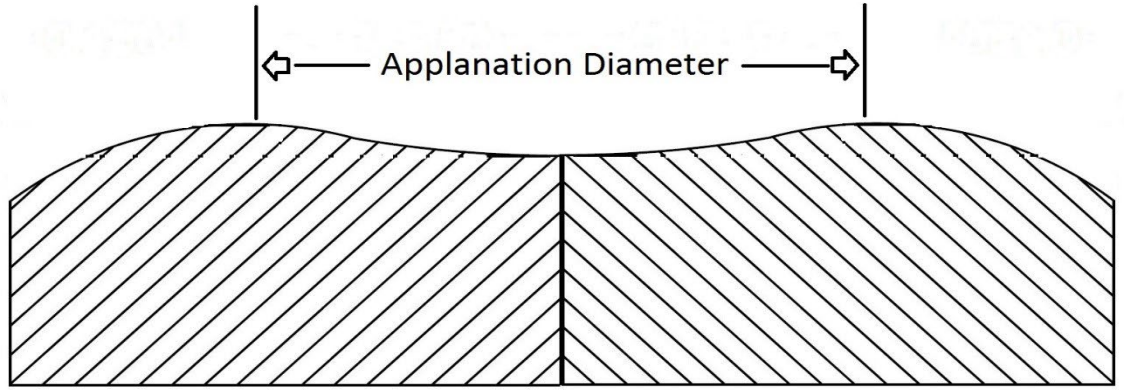
CATS: Correcting Applanation Tonometry Surface

Inventor Sean McCafferty MD

Sean McCafferty is an Ophthalmologist with a degree in Mechanical Engineering and a Master of Science in optical engineering. This unique combination of skills equipped him to envision the CATS™ Tonometer Prism design in 2011.

After years of work, the device became FDA cleared in October 2018.

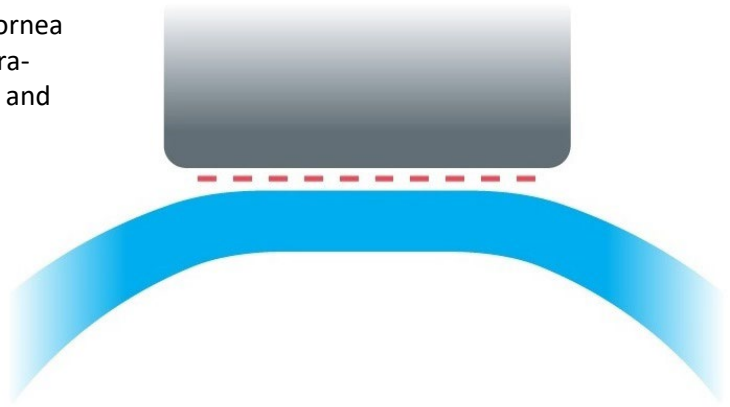
CATS is simply a replacement prism for any Goldmann applanation or Perkins tonometer. The CATS Tonometer Prism™ utilizes a concave contact surface to minimize mechanical bending resistance of the cornea. The device also features a tapered edge, which helps to reduce the influence of tear-film adhesion.



CATS: Correcting Applanation Tonometry Surface

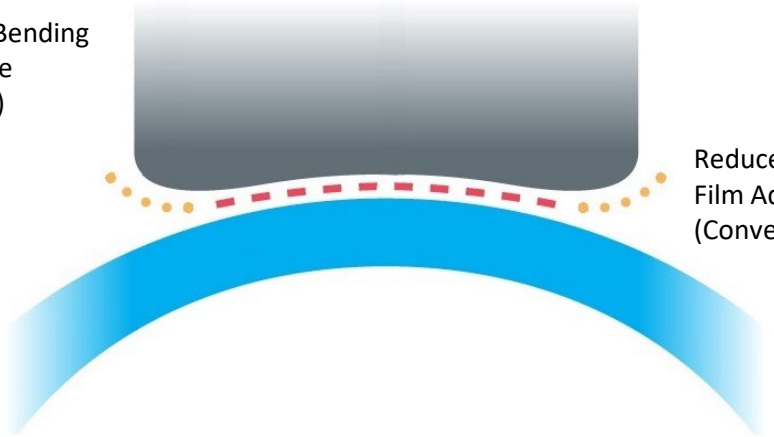
Traditional GAT Prism – No change in 65 Years

Flattens the Cornea Amplifying Intra-Corneal Stress and IOP errors



CATS™ Tonometer Prism – the New Shape of IOP

Reduces Bending Resistance (Concave)



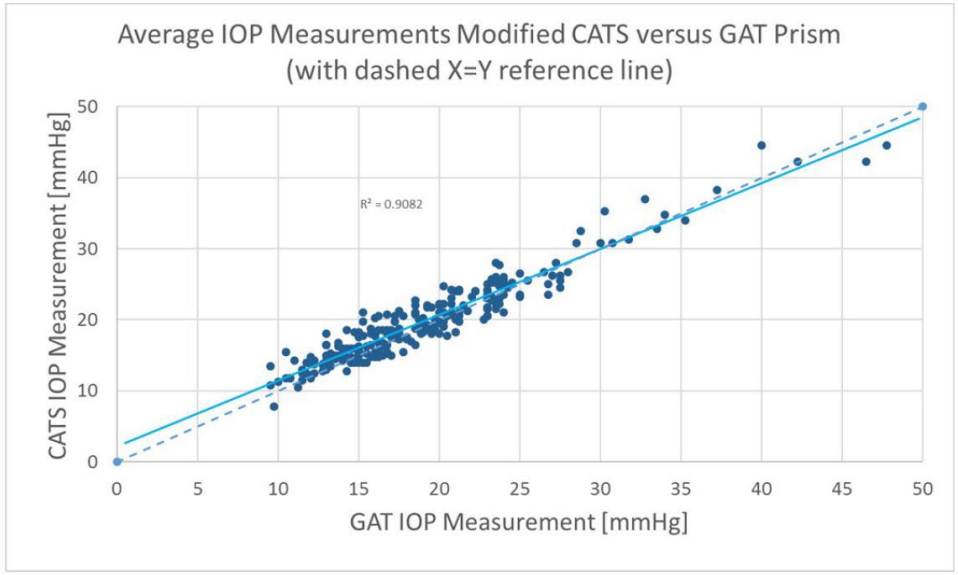
Reduces Tear Film Adhesion (Convex)

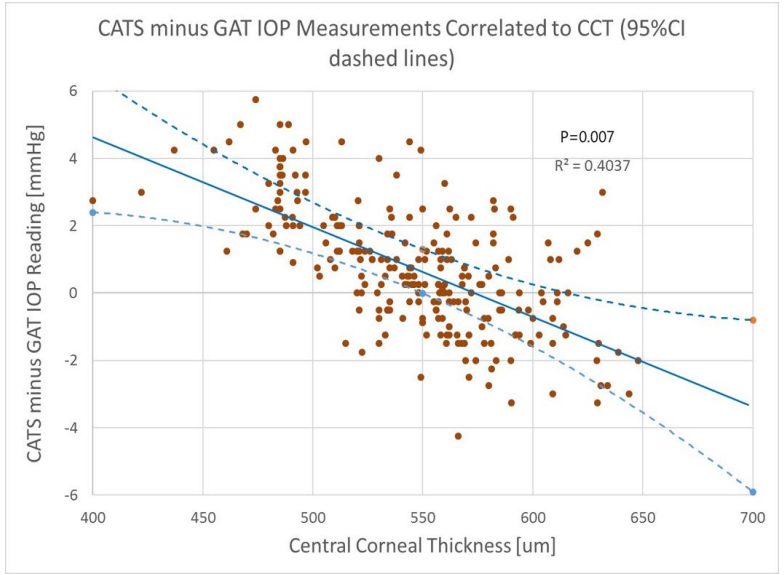
CATS: Compare CATS to GAT in Normal Eyes

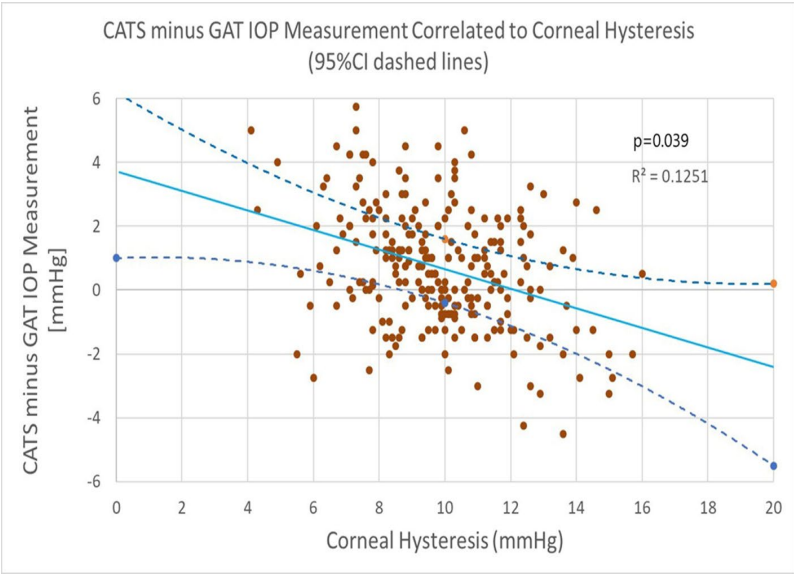
Purpose:

1. Compare CATS to GAT in 243 Normal Eyes with Central Corneal Thickness between 400 – 650 Microns

2. Evaluate the impact of corneal properties on GAT and CATS





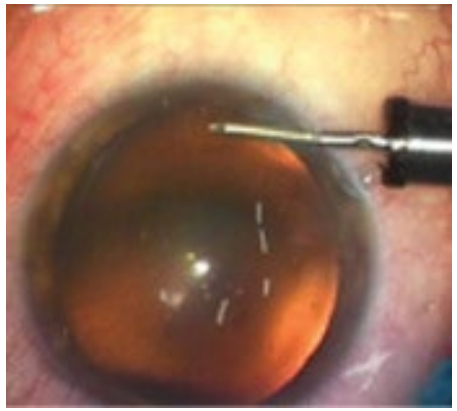


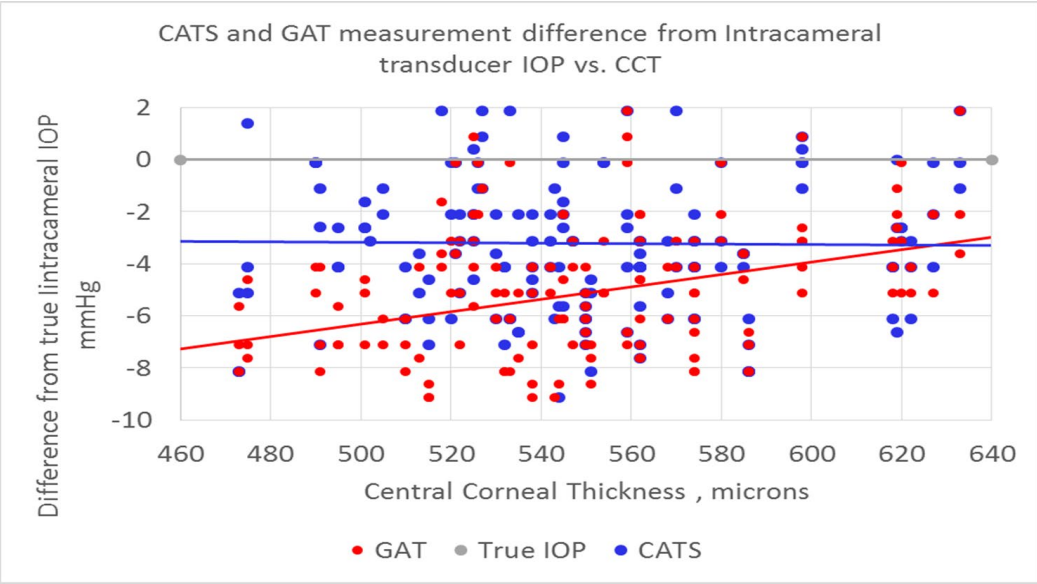
A significant reduction in CATS prism's sensitivity to CCT and CH was demonstrated compared with the traditional GAT prism

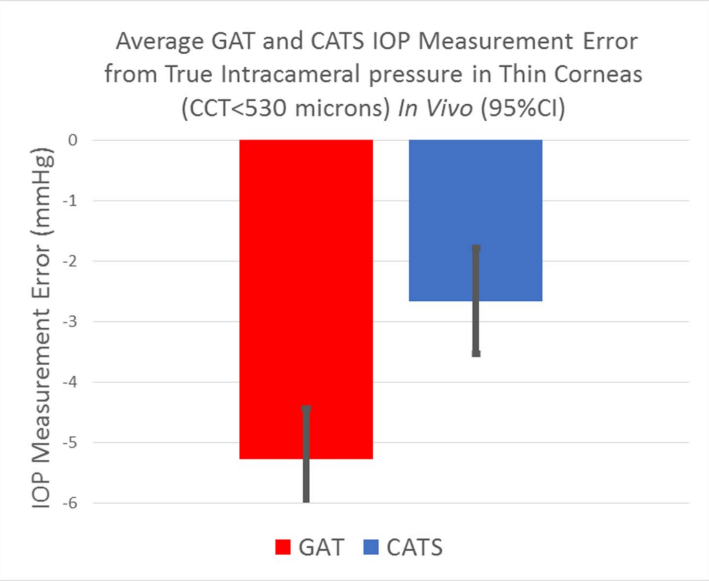
CATS Intercameral Pressure Validation

Methods:

- Intracameral IOP measured on 58 eyes undergoing cataract surgery
- IOP manometrically modulated to 10, 20, and 40 mmHg
- Difference between the CATS and GAT IOP measurements from true intracameral pressure correlated to the error parameters







The CATS prism is significantly more accurate compared to the GAT prism compared to true intracameral pressure, and is unaffected by CCT.

Clinical Evidence – Study 1

Corneal Hysteresis found to be associated with progression

- The first observational study to investigate the relationship of Corneal Hysteresis to a variety of other parameters in a glaucoma population

- 230 POAG or suspected POAG patients were included in the study
  - POAG was defined by a reliable visual field that was abnormal according to OHTS criteria, with an optic nerve image, photo, or CDR thought to be consistent with the field damage by a fellowship-trained glaucoma specialist.
  - GAT, ORA, CCT and Axial Length measurements (IOL master) were recorded
  - Among persons with three or more reliable fields over three or more years, or with five reliable fields in less than three years, progression was defined as having achieved the OHTS standard of “conversion” (if previously normal), or (if previously damaged as evidenced by an abnormal GHT or PSD) having worsened by 1 dB or greater per year in either MD or PSD.
  - A stepwise model was not used nor were any hypotheses about interactions made.

POAG Primary Open Angle Glaucoma; GAT Goldmann Applanation Tonometry; IOP intraocular pressure; ence limit.

CCT Central Corneal Thickness; CH Corneal Hysteresis

Congdon NG et al. *Am J Ophthalmol.* 2006;141:868-875.

Clinical Evidence – Study 1

Corneal Hysteresis found to be associated with progression

	OR	LCL	UCL	*P*-value
Age per year <65	1.12	1.01	1.24	.03
Age per year >65	1.08	1.01	1.15	.02
GAT IOP per mmHg	1.22	0.95	1.58	.12
Treatment	1847.6	3.16	10^6	.02
IOP by treatment interaction	0.79	0.61	1.03	.08
CCT per 100 microns	1.65	0.66	0.98	.30
Years with glaucoma	1.00	0.96	1.04	.98
Baseline IOP	0.99	0.93	1.06	.79
CH per mmHg	0.81	0.66	0.98	**.03**

Conclusions: Corneal Hysteresis was the parameter most associated with progressive field worsening

GAT Goldmann Applanation Tonometry; IOP intraocular pressure; OR odds ratio; LCL lower confidence limit; UCL upper confidence limit.

CCT Central Corneal Thickness

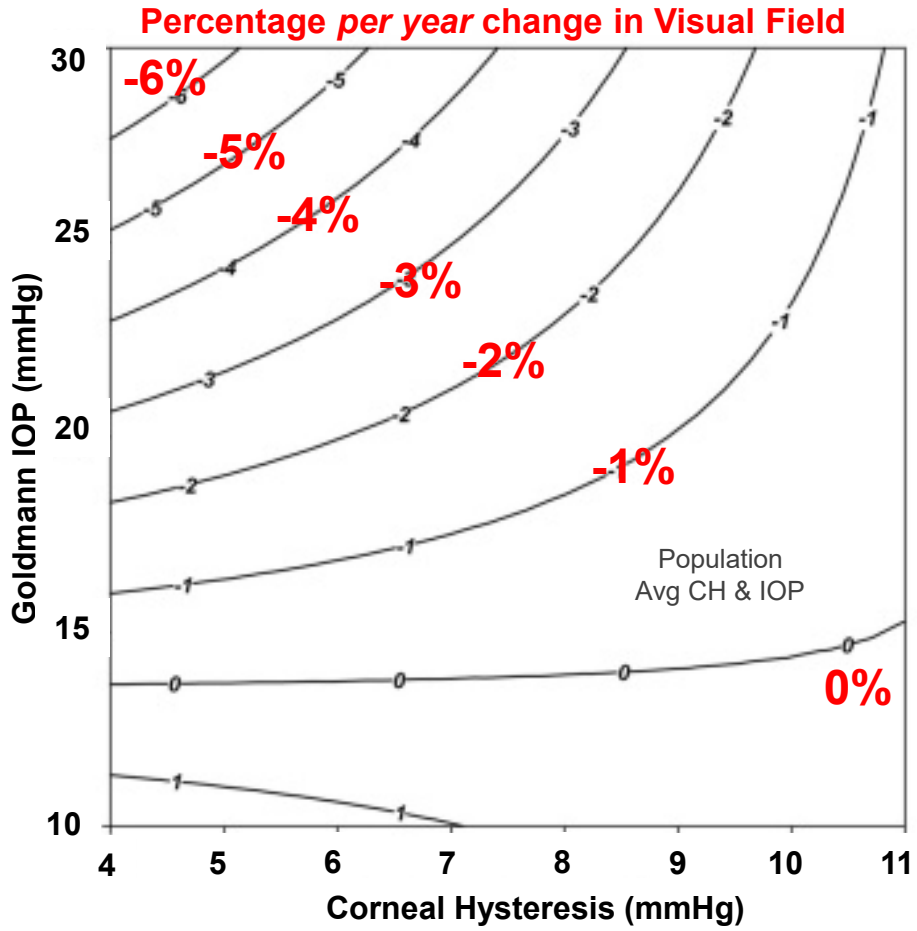
Corneal Hysteresis in Glaucoma

Predictive of Progression in Prospective, Longitudinal Study (DIGS)



Medeiros FA et al.
Ophthalmology. 2013;120:1533-1540.

"The Effect of IOP on rates of progression was dependent upon Corneal Hysteresis"

- For eyes with lower CH, the impact of IOP on VF loss was significantly greater
- **IOP of 30** is not so bad with a CH of 11.
- **IOP of 20** is very bad with a CH of 6

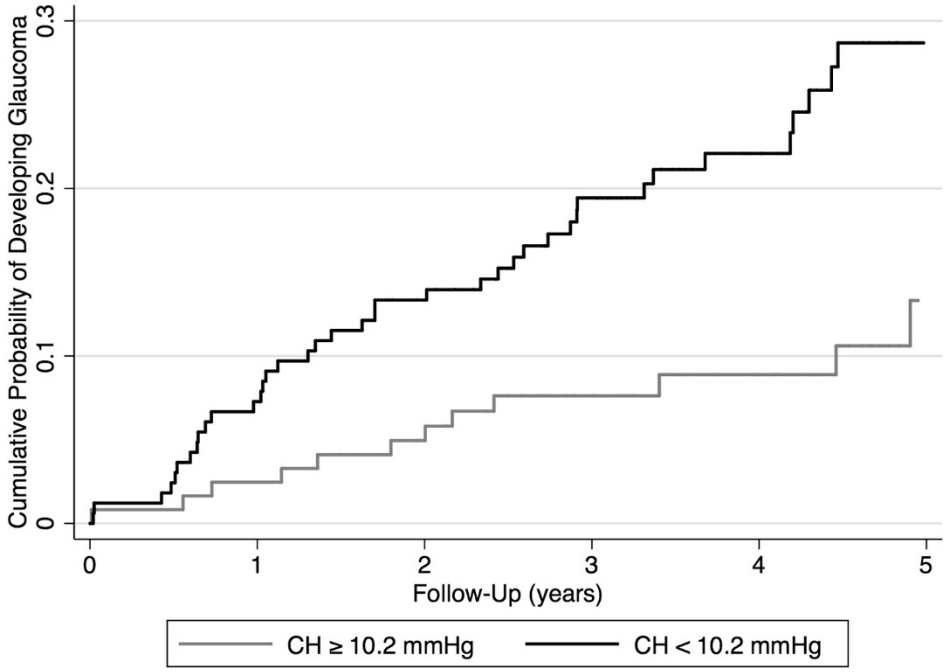
Corneal Hysteresis in Glaucoma

Predictive of conversion to Glaucoma in pre-perimetric Glaucoma Suspects

Purpose: To investigate the role of CH as a risk factor for **development** of glaucoma in a prospective longitudinal study.

Results: Fifty four (19%) of the 287 eyes developed repeatable visual field defects during a 4 year follow-up.

CH was *independently* predictive of conversion to glaucoma even when adjusted for age, IOP, and CCT.



Each 1mmHg lower CH was associated with an increase of 21% in the risk of developing glaucoma during follow up

A Prospective Longitudinal Study to Investigate Corneal Hysteresis as a Risk Factor for Predicting Development of Glaucoma
AJOPHT 10365 – in press
Author Block: Feilin Zhu , Alberto DinizFilho, Linda M. Zangwill , Felipe A. Medeiros

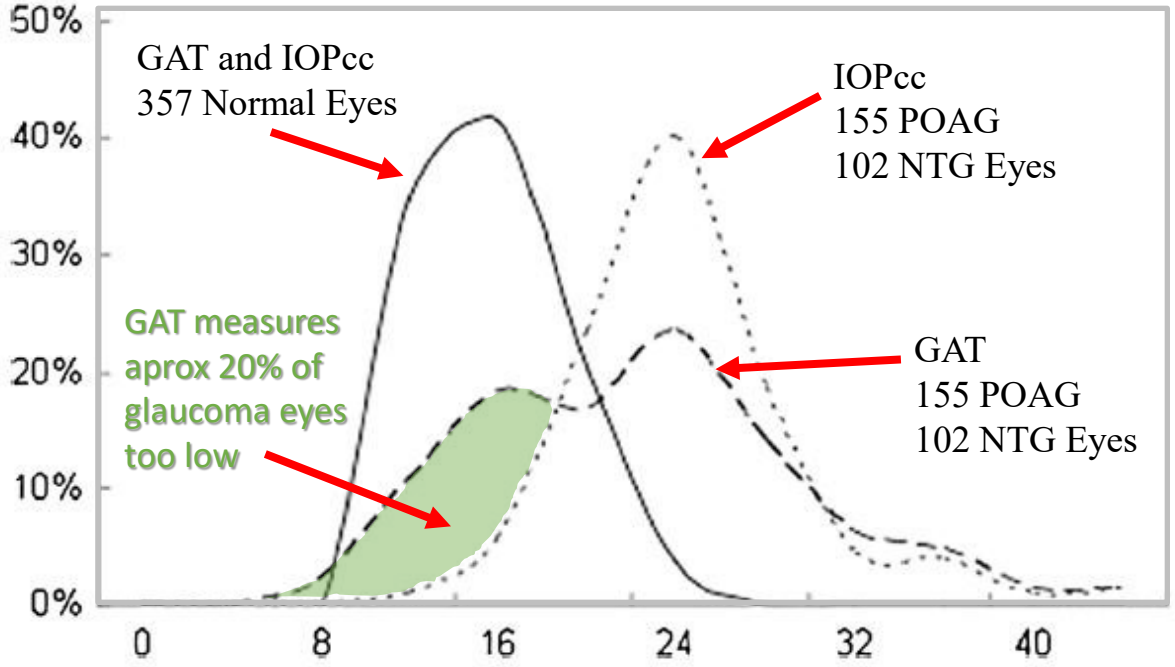
Corneal Compensated IOP

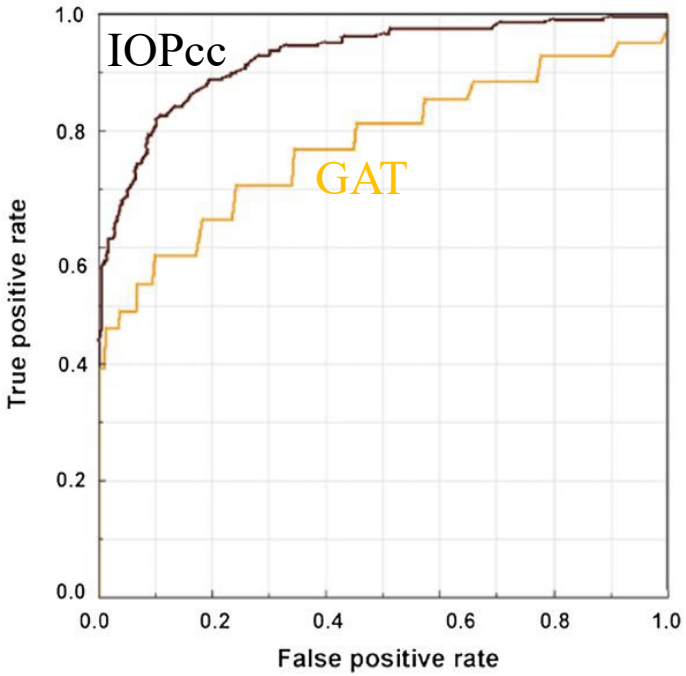
- Superior to Goldmann in all forms of post Refractive Surgery IOP measurements

IOPcc Key Benefit #2
IOPcc is superior for glaucoma risk assessment

IOPcc is clinically superior to GAT, other NCTs, and iCare because it is more associated with Glaucoma risk, status of glaucoma, and glaucoma progression

"the results of this study suggest that IOPcc may represent a superior test for the evaluation of glaucoma"





AUC .93 for IOPcc vs .78 for GAT

Not shown here from this study:

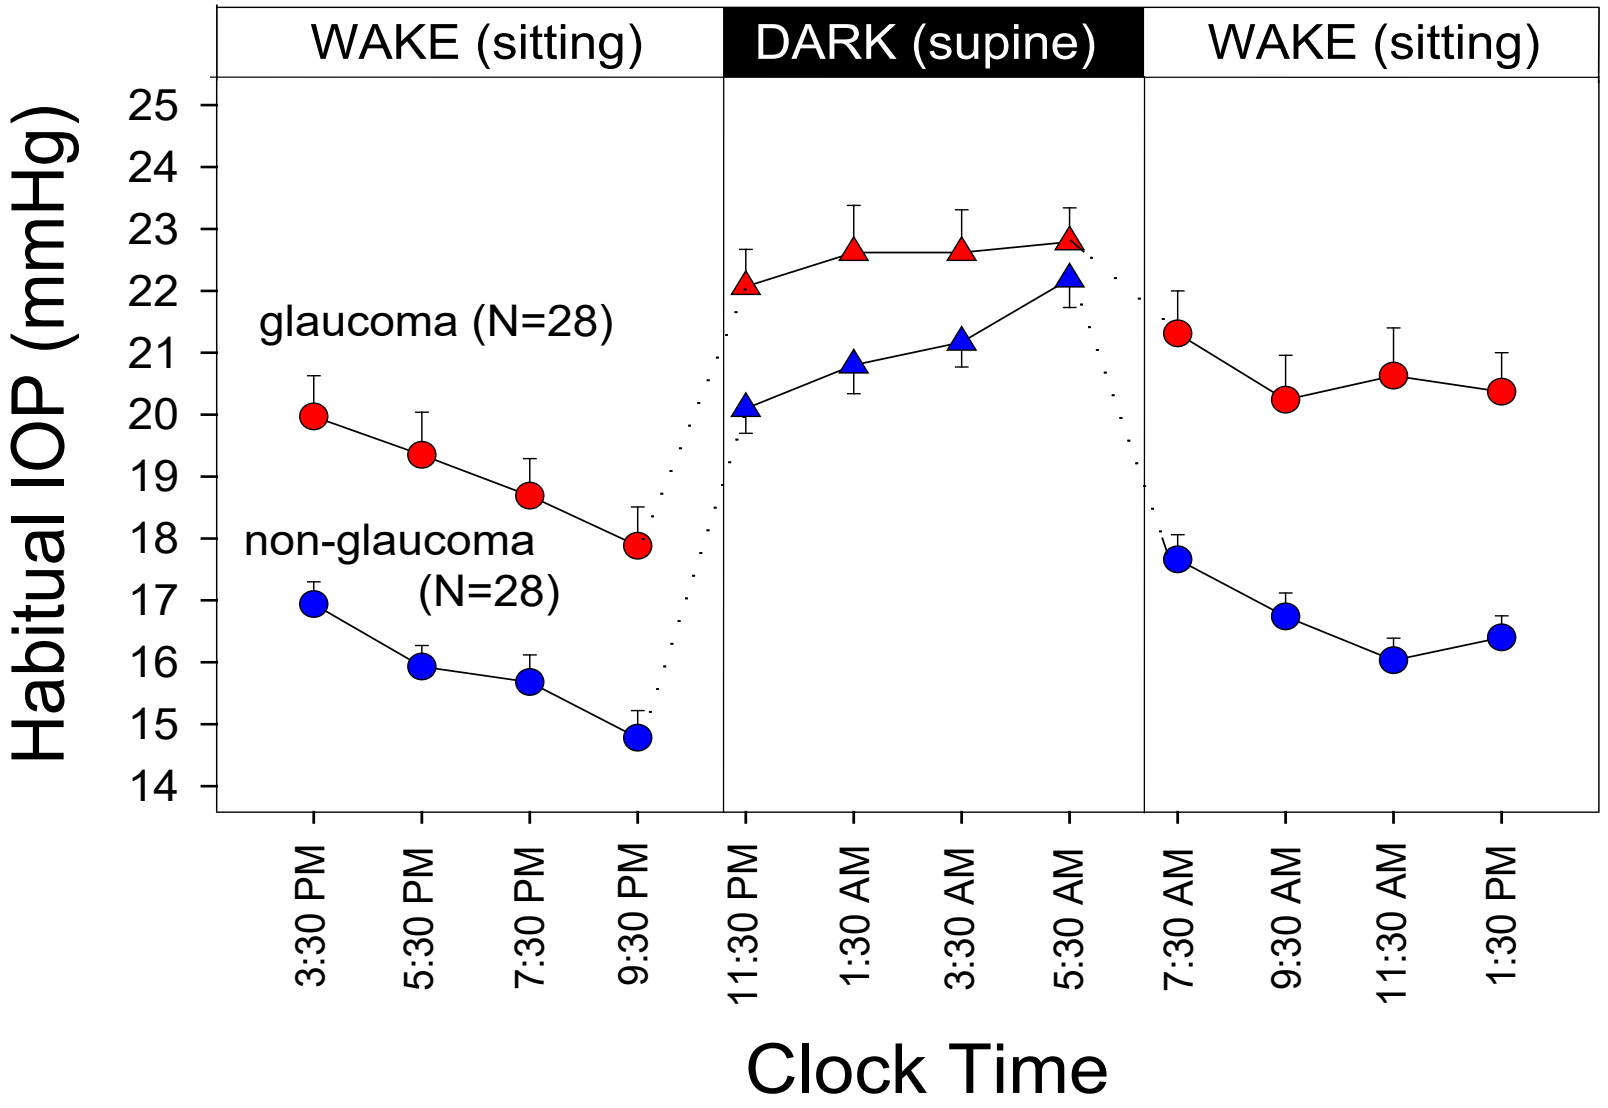
- **39%** of NTG eyes would be re-classified as POAG with IOPcc
- Average IOPcc was **5 mmHg higher** than GAT in NTG eyes

Goldmann applanation tonometry compared with corneal-compensated intraocular pressure in the evaluation of primary open-angle Glaucoma
Joshua R Ehrlich, Nathan M Radcliffe, and Mitsugu Shimmyo

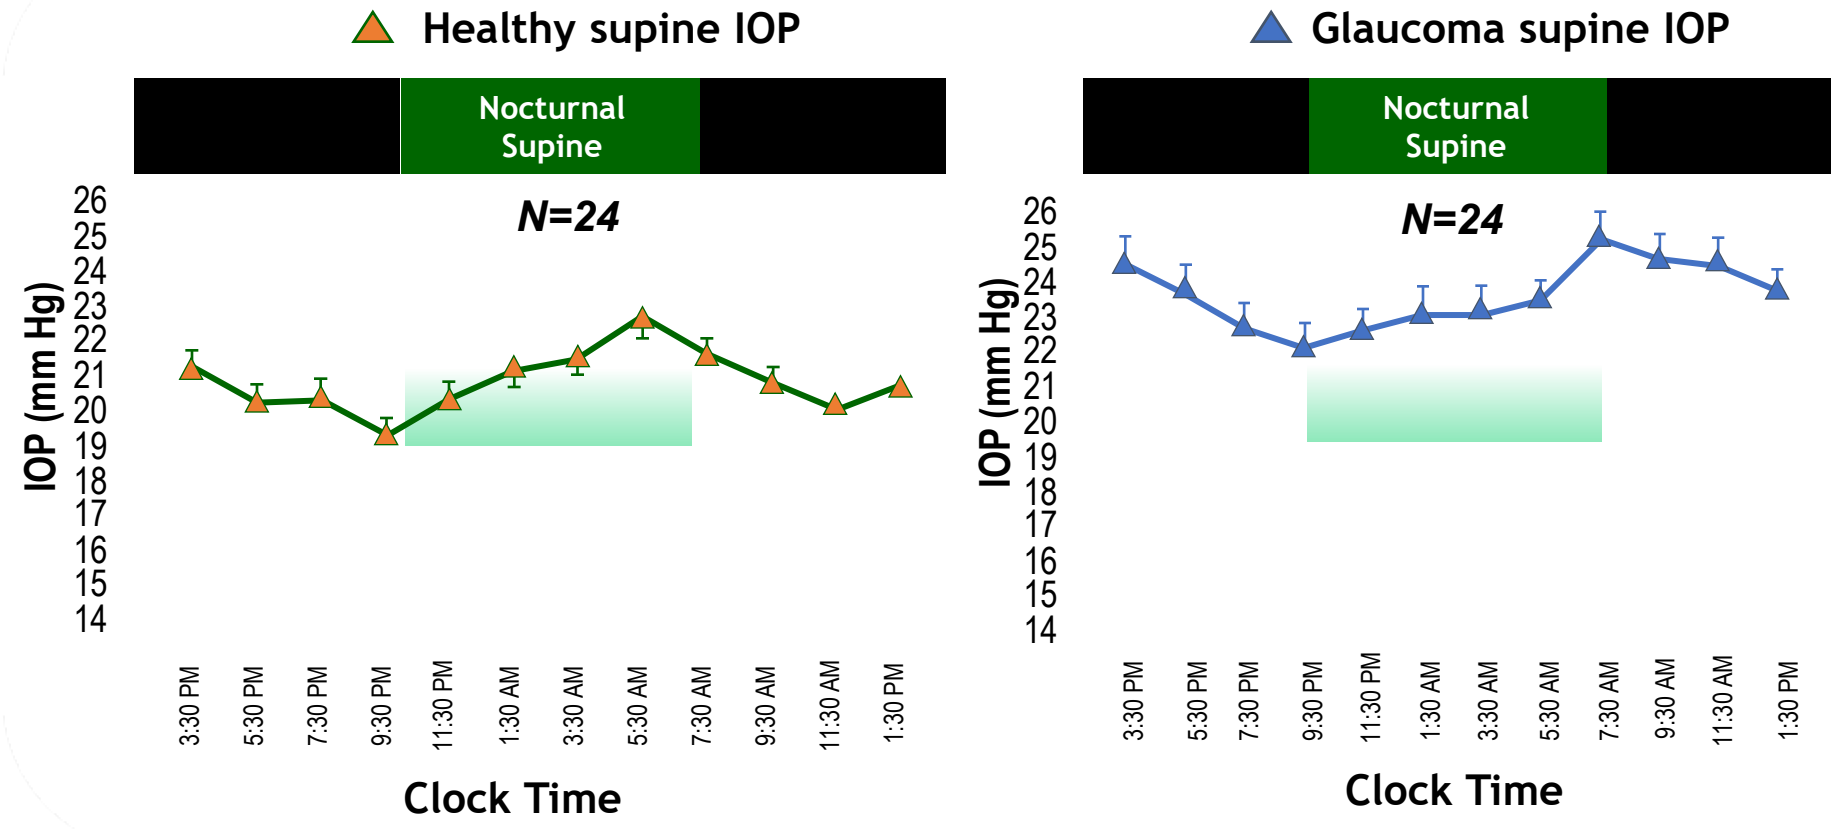
24-Hour IOP Monitoring

- How do we evaluate IOP if we are only measuring it briefly in office?
- Currently we make decisions based upon single in-office IOP but patient's IOP may vary at other times
  - With 24 hour IOP measurement, will be able to determine our treatment target based upon IOP peak, 24-hour mean or fluctuation over 24 hours
  - New 24-hour devices may be able to synchronize drug release with peaks of IOP
- 24-hour IOP monitoring systems
  - Better define target IOPs leading to better therapies
  - Personalize glaucoma care
- Three approaches to measure IOP over 24 hour period
  - Self tonometry
  - Permanent continuous IOP monitoring
  - Temporary continuous IOP monitoring

24-hour IOP pattern (ages 40-80)
glaucoma vs. non-glaucoma

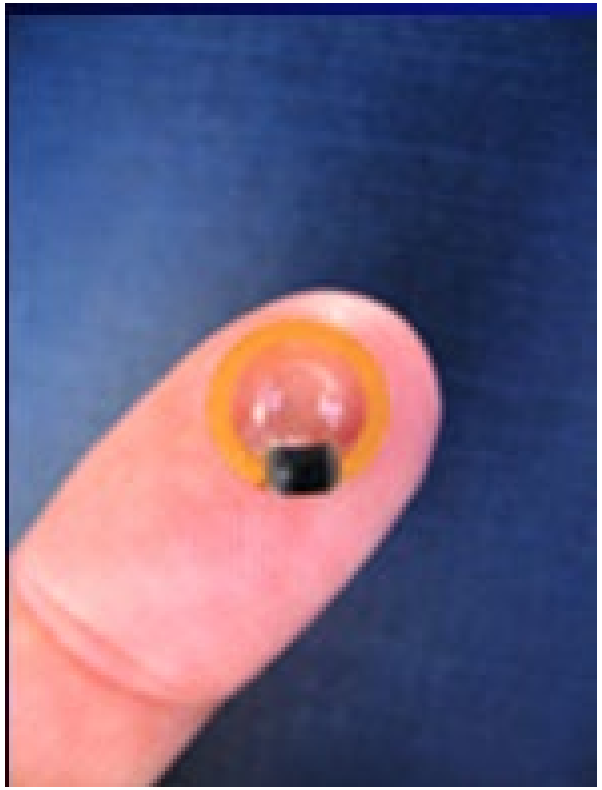


IOP Is Higher At Night



Liu, Zhang, Kripke, Weinreb. *Invest Ophthalmol Vis Sci*. 2003;44:1586-1590.

Implantable IOP monitor



Temporary Continuous IOP Monitoring

- Triggerfish contact-lens system
  - FDA approved March 2016 but not available for sale in US
  - Measures changes in corneal curvature as surrogate for IOP

Triggerfish Contact Lens Monitor

- Provides 24 hour IOP monitoring, including the sleep period
- Takes measurement every five minutes
  - 288 times per day
- At the five minute measurement, obtains 300 data points
  - 10 Hz for 30 seconds
- Main concern is that instrument does not provide IOP measurement
  - Provides change in corneal curvature, based upon peripheral corneal measurement that correlates with change in IOP
  - Detect fluctuations in IOP

VERSÉA
OPHTHALMICS

Building a dedicated and experienced ophthalmics division

Focusing on complete ocular diagnostic and therapeutic solutions

Providing rapid point-of-care (POC) testing that guides clinical management and therapeutic interventions, such as novel biologics, to improve patient care for those afflicted with ocular surface disease

OCULAR SURFACE DISEASE TREATMENT OPTIONS & LIMITATIONS: THE IMPORTANCE & VALUE OF SYMPTOM RELIEF & PATIENT SATISFACTION

Artificial tears, lubricants, tear duct plugs, steroids, antibiotics, cyclosporine, scleral lenses, and serum tears do not fully address the underlying disease process or promote mechanisms that facilitate long-term wound repair.

Patients suffer pain, scarring, vision loss, and require frequent regimen of topical medication, which often leads to severe ocular side effects. Corneal staining persists in the majority of patients despite aggressive treatment.

25%

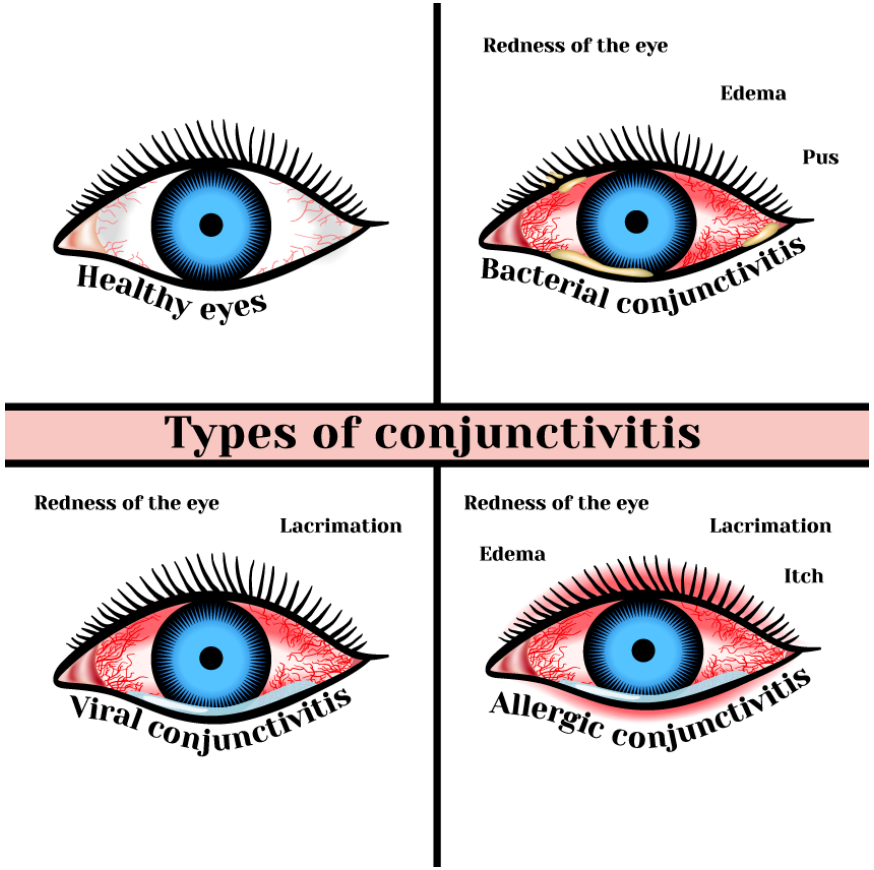
of patients are somewhat dissatisfied or dissatisfied with their current medication.

37%

of patients report ineffective symptom relief.

White DE, Zhao Y, Jayapalan H, Machiraju P, Periyasamy R, Ogundele A. Physician Satisfaction with Anti-Inflammatory Topical Medications for the Treatment of Dry Eye Disease. Clin Ophthalmol. 2020;14:931-938. Published 2020 Mar 25. doi:10.2147/OPTH.S237832.

Infectious Conjunctivitis (Red Eye)



- Can be caused by virus, bacteria, or allergy
- Affects approximately 2% of the population annually in the U.S.[1]
- 1-2% of all office visits[2]
- ~50% of patients clinically misdiagnosed using symptoms and signs[3]

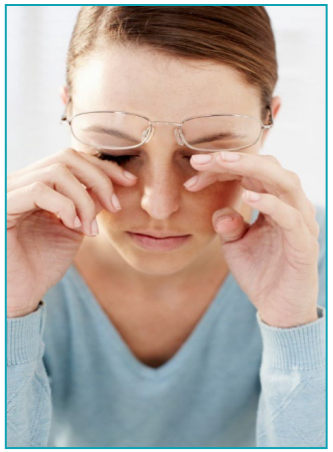
Incorporating Tear-Based Diagnostics into Practice

Point-of-Care testing can be used on these types of patients:



Symptomatic Ocular Surface Disease

- Patients presenting with complaints of sandy/gritty, burning, stinging, foreign body sensation, itching, eye fatigue, fluctuating vision, or tearing should be considered for routine tear-based testing

Contact Lens Fittings

- Contact lens intolerance and dropout frequently caused by underlying ocular surface disease

Pre-operative Testing

- Testing all pre-operative LASIK and cataract surgery patients for ocular allergy and dry Eye will help determine who may benefit from more aggressive treatment to optimize the ocular surface prior to surgery

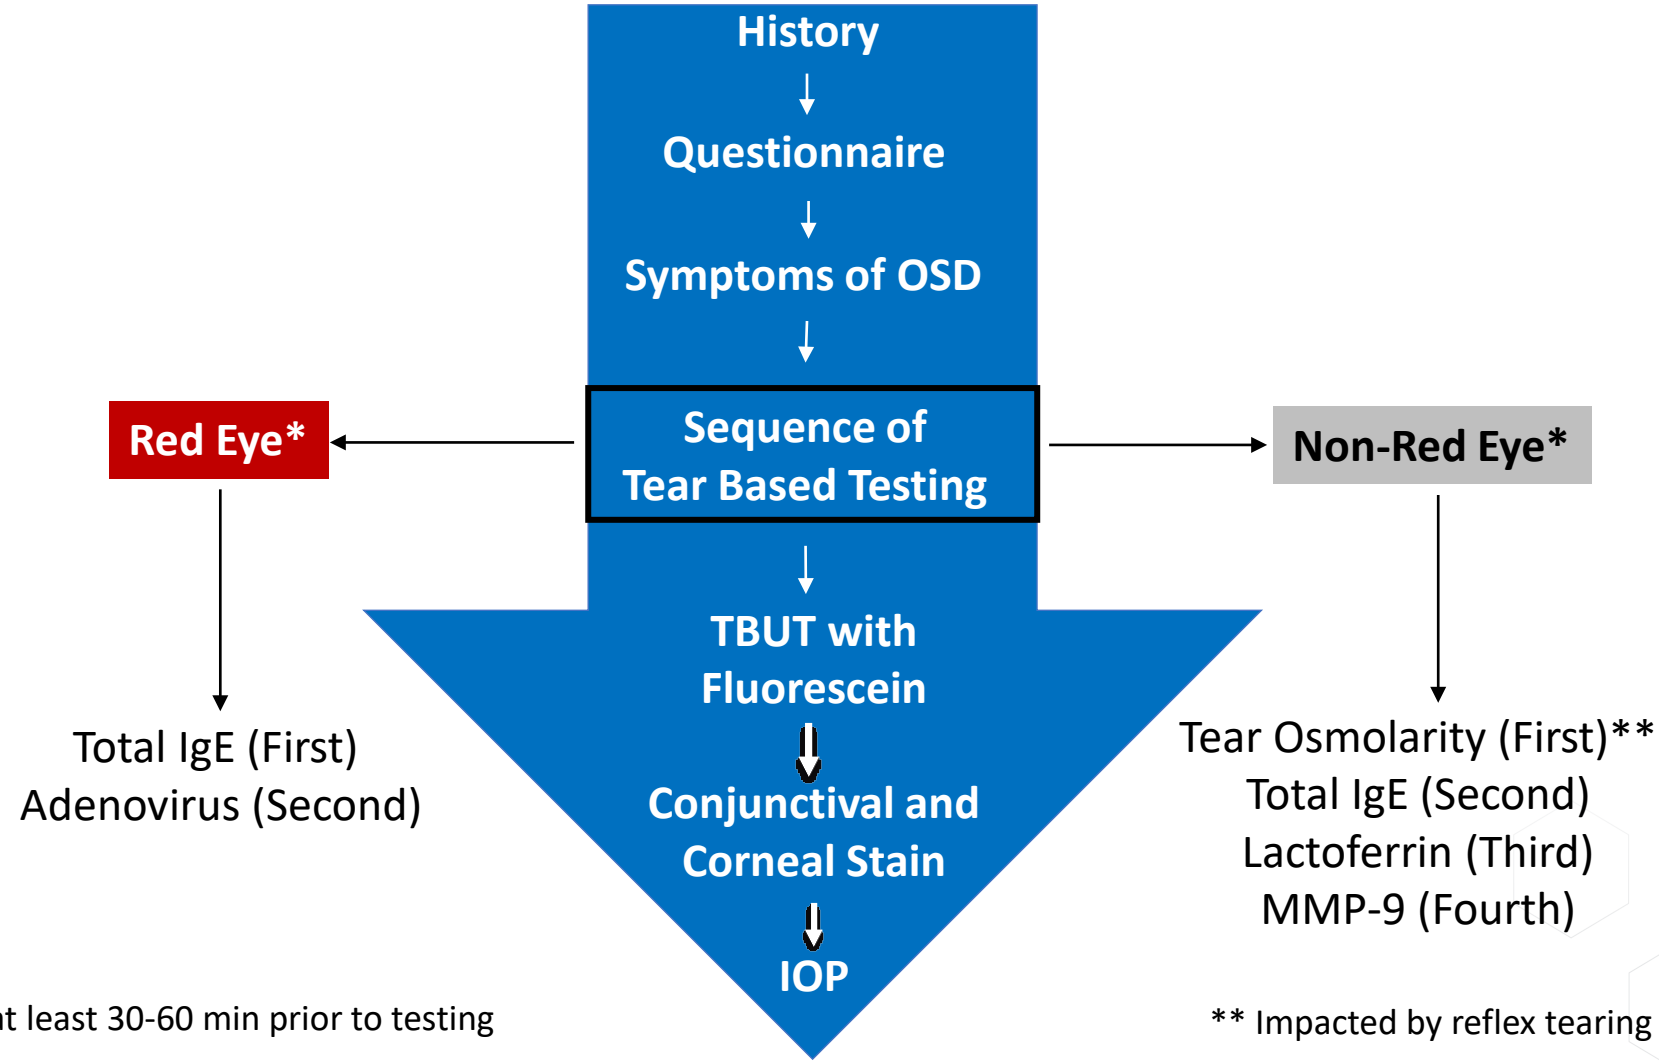
Potential POC Testing Workflow



* No drops at least 30-60 min prior to testing

** Impacted by reflex tearing

T-POC TOTAL IgE TESTING
Is There An Allergic Component?

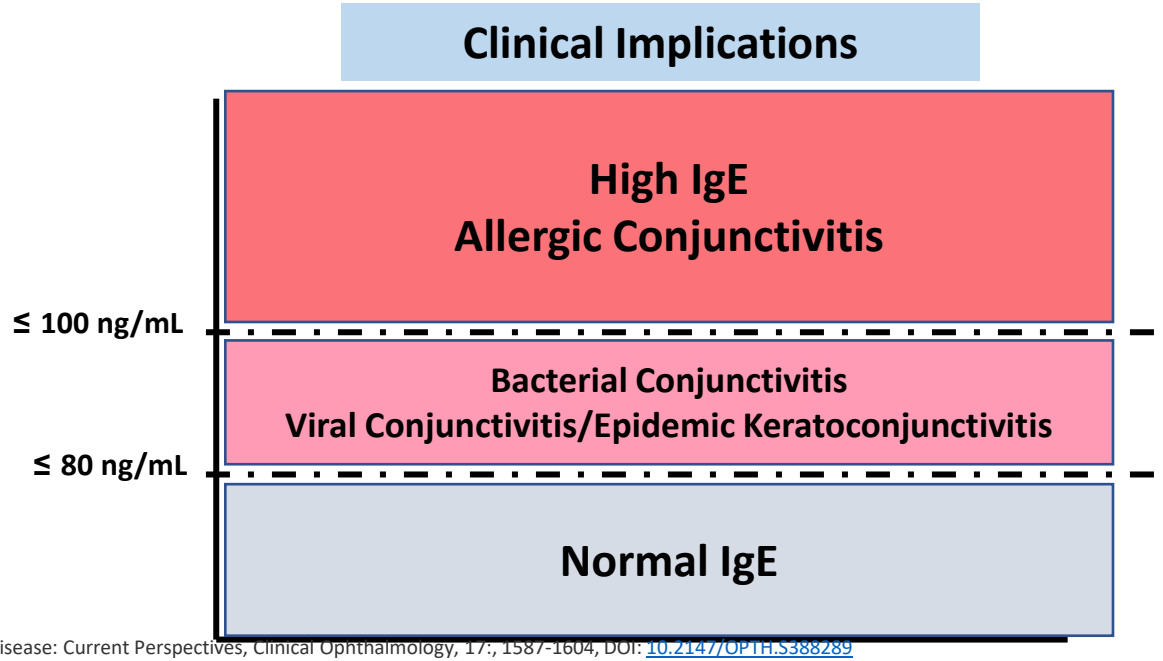
Benefits of testing IgE levels in the tear film:

- Presence of IgE indicates the diagnosis of allergic conjunctivitis (seasonal, perennial, atopic, and vernal)
- Levels of IgE increase with severity
- IgE testing can help differentiate allergic conjunctivitis from dry eye and viral conjunctivitis
- Elevated IgE causes tear film instability
- Changes in IgE levels may show the efficacy of prescribed treatment

If IgE value is < 80 ng/mL (33 kIU), there is a 95.7% probability that the patient does not have an ocular allergy

If IgE value is ≥ 80 ng/mL, there is a 92.9% probability that this elevated IgE is indicative of an ocular allergy

Sensitivity: 93%
Specificity: 96%
Dynamic range: 20 ng/mL - 2,000 ng/mL
Coefficient of variation: < 9%



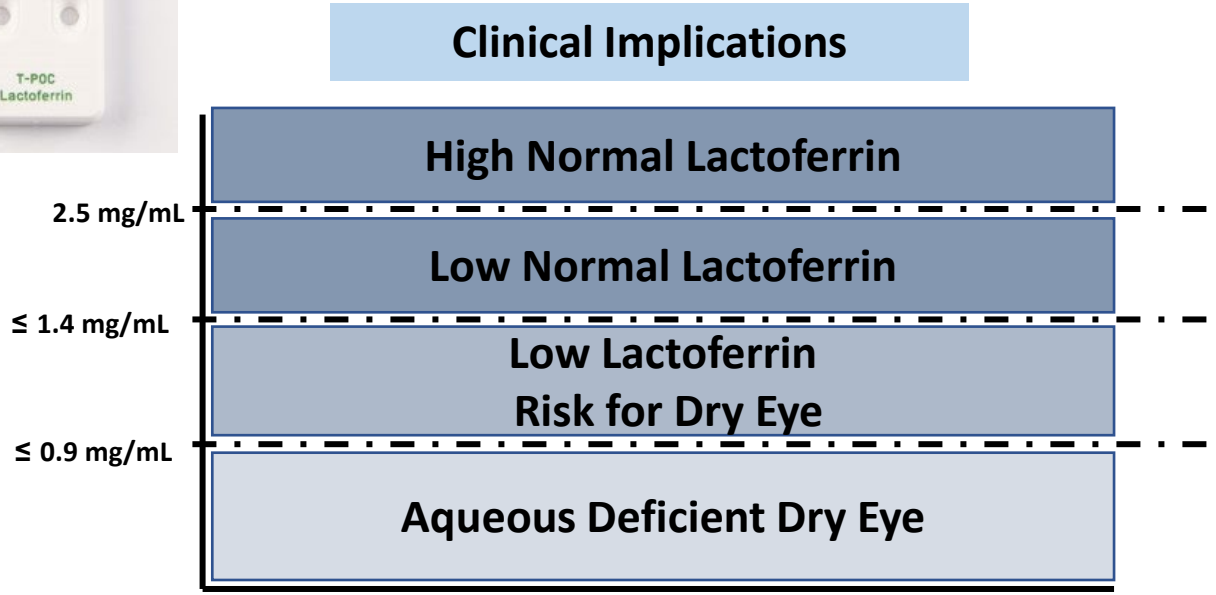
Thomas Chester, Sumit (Sam) Garg, Josh Johnston, Brandon Ayers & Preeya Gupta (2023) How Can We Best Diagnose Severity Levels of Dry Eye Disease: Current Perspectives, Clinical Ophthalmology, 17:, 1587-1604, DOI: 10.2147/OPTH.S388289
. Nomura K, Takamura E. Tear IgE concentrations in allergic conjunctivitis. Eye (Lond). 1998;12 (Pt 2):296-8.

T-POC LACTOFERRIN TESTING
Is it Aqueous Deficient or Evaporative Disease?

Benefits of testing Lactoferrin levels in the tear film:

- Low Lactoferrin levels less than 1.4 mg/mL) directly correlate to DED caused by aqueous deficiency
- Severity of DED can be determined by the Lactoferrin level
- Lactoferrin ≤ 0.9 mg/mL has 72% sensitivity and 95% specificity for Sjogren's Disease for further testing
- Low Lactoferrin levels indicate DED with increased surgical risk
- Low Lactoferrin levels may indicate the cause of contact lens intolerance
- Changes in Lactoferrin levels may show the efficacy of the prescribed treatment
- Lactoferrin levels are normal, and not reduced, in the setting of meibomitis-related rosacea

Sensitivity: 83%
Specificity: 99%
Dynamic range: 0.4 mg/mL – 2.5 mg/mL
Coefficient of variation: < 9%



Thomas Chester, Sumit (Sam) Garg, Josh Johnston, Brandon Ayers & Preeya Gupta (2023) How Can We Best Diagnose Severity Levels of Dry Eye Disease: Current Perspectives, Clinical Ophthalmology, 17:, 1587-1604, DOI: 10.2147/OPTH.S388289

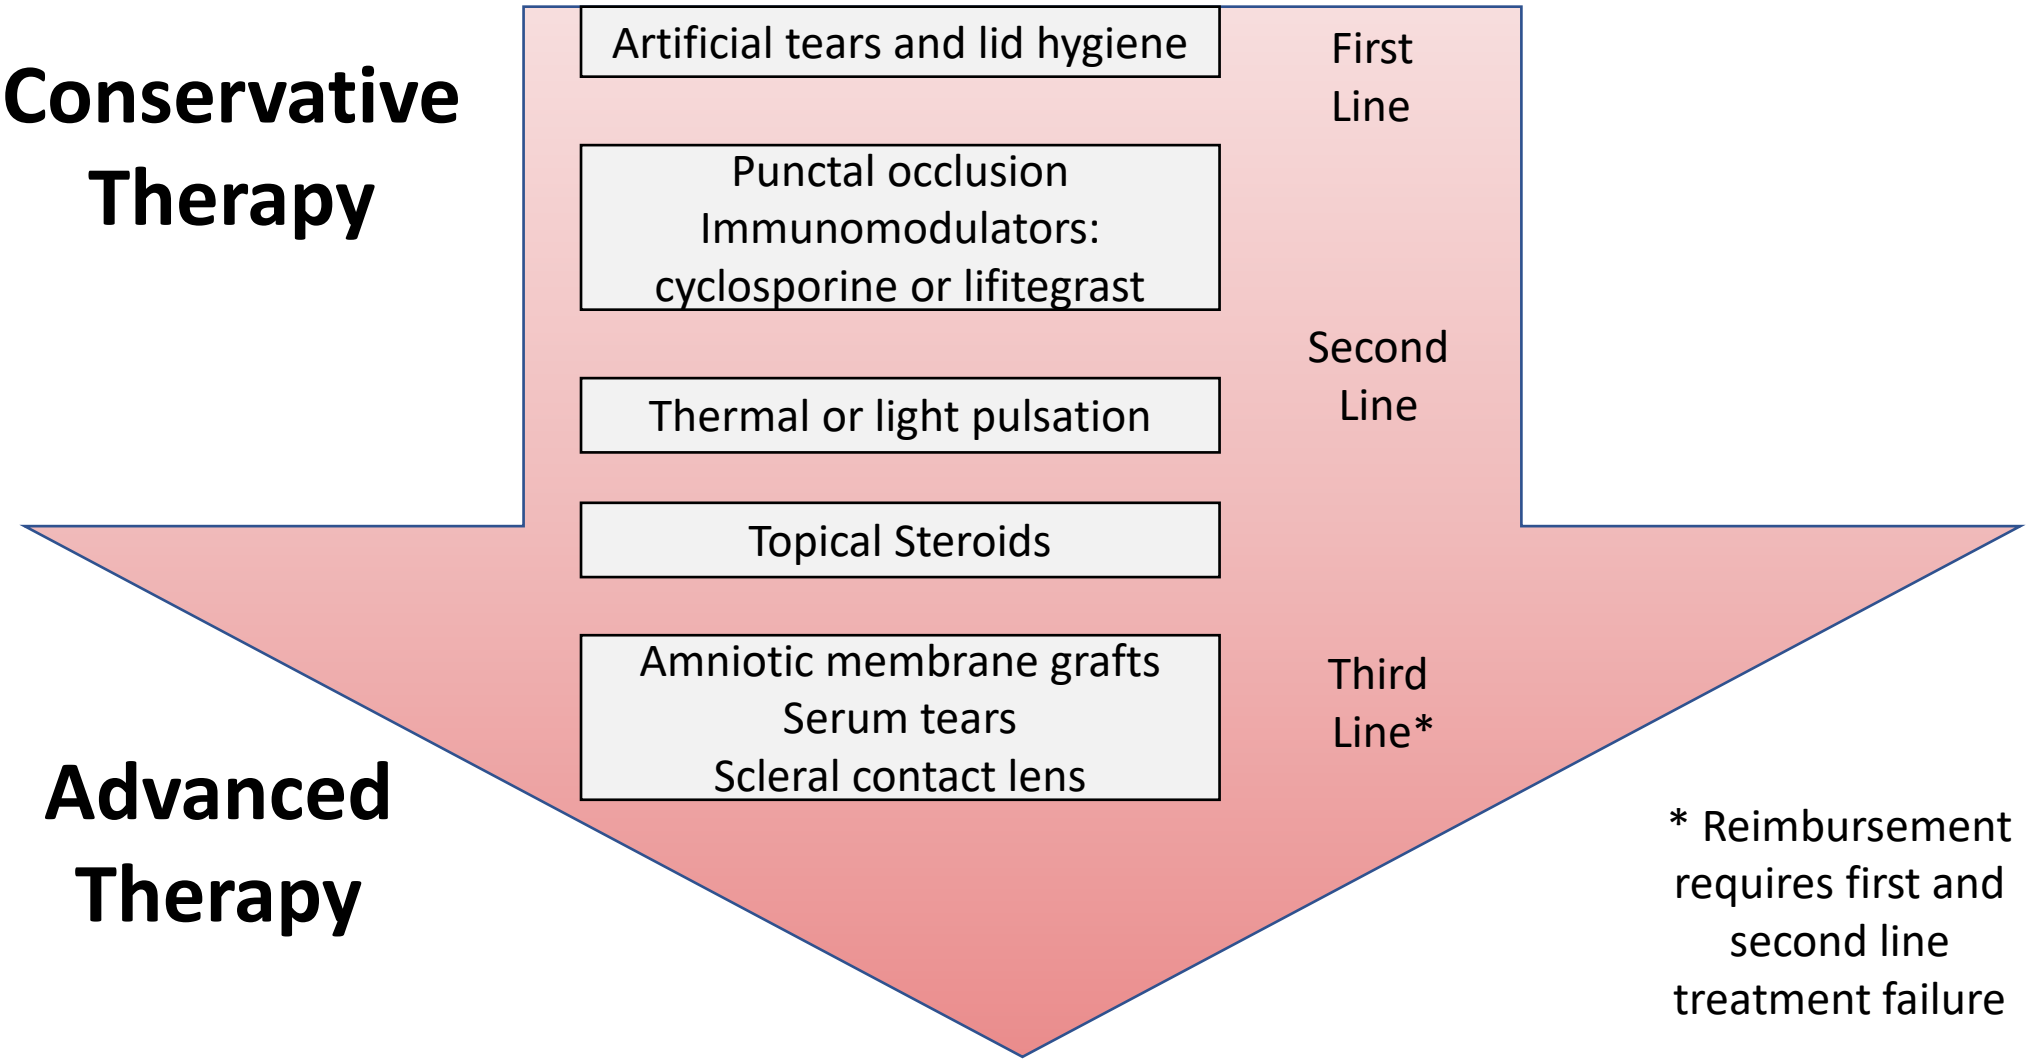
Ocular Surface Disease Treatment Plan



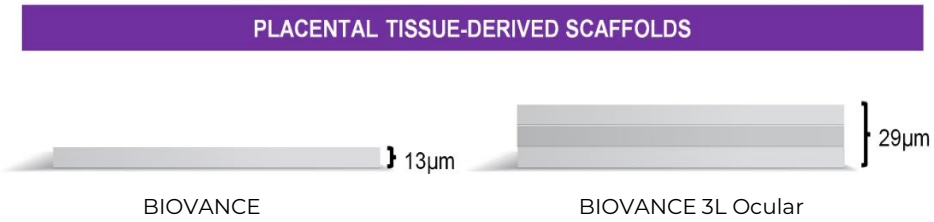
* Reimbursement requires first and second line treatment failure

CORNEAL DEFECTS

- Corneal epithelial defects are focal areas of epithelial loss most frequently caused by mechanical trauma, corneal dryness, neurotrophic keratitis, post-surgical changes, or infection (ref 10)
- Amniotic membrane graft applications as a cover or barrier may include, but are not limited to, corneal and conjunctival related injuries or defects such as corneal epithelial defects, pterygium repair, fornix reconstruction and other procedures
- Common diagnoses resulting in or associated with corneal defects include:

BIOVANCE 3L OCULAR

- Request for Designation (RFD) as a 361 biological product granted
- Unique 3-layer amnion basement membrane construction
- Decellularized Dehydrated Human Amniotic Membrane (DDHAM)
- Designed for superior handling while optimizing a ringless design
- ***Cell attachment is a natural stimulus for the orderly release of growth factors and cytokines***[1]
- A benchtop study showed*[2,3]
  - Cell viability
  - Cell adhesion
  - Cell proliferation



***An in vitro test was conducted to measure viability, adhesion, and proliferation of human corneal and conjunctival epithelial cells at days 1, 4, and 7**

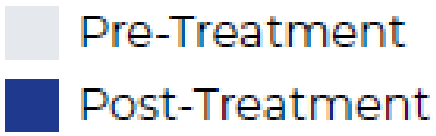
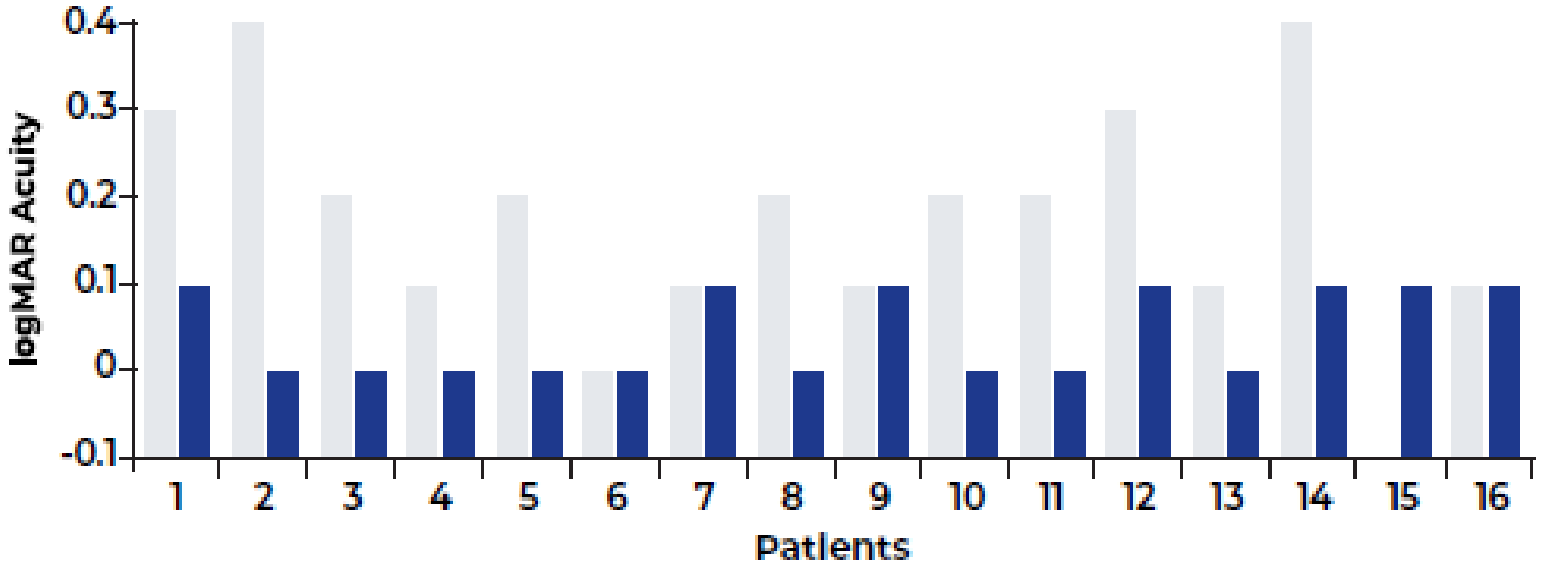
Post procedure BCVA improved in all patients with an initial BCVA less than 20/25.[14]

BCVA: Best Corrected Visual Acuity





Chima H. Cianciolo M. Pilot Evaluation of Biovance® 3-Layer Amniotic Membrane Graft for Ocular Surface Disease. American Optometric Association Meeting 2023.

Comparative Benchtop Study Findings:

Biovance® 3L (DDHAM) / Ambio2® (DHAM) / AmnioGraft® (CHAM)

An in vitro test was conducted to measure viability, adhesion, and proliferation of human corneal and conjunctival epithelial cells at days 1, 4, and 7

DDHAM (Biovance 3L Ocular) = Decelluarized, Dehydrated human amniotic membrane
ChAM (AmnioGraft) = Cryopreserved human amniotic membrane
DhAM (Ambio2) = Dehydrated human amniotic membrane

Ocular epithelial **cell viability** significantly greater than ChAM and DhAM ($p<0.001$)

Ocular epithelial **cell adhesion** significantly greater as compared to ChAM ($p<0.001$) and DhAM ($p<0.011$)

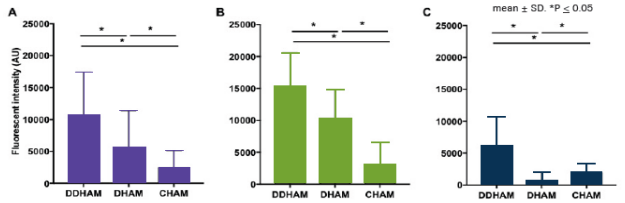
Ocular epithelial **cell proliferation** rate significantly greater than ChAM ($p<0.001$)

Corneal and Conjunctival Cells

Corneal Cells

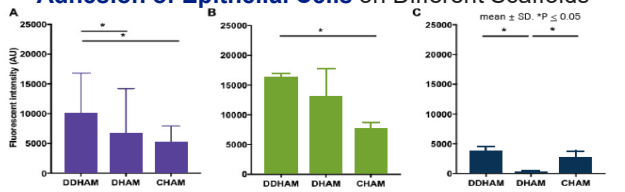
Conjunctival Cells

Epithelial Cell Viability by Cell Type and Scaffold



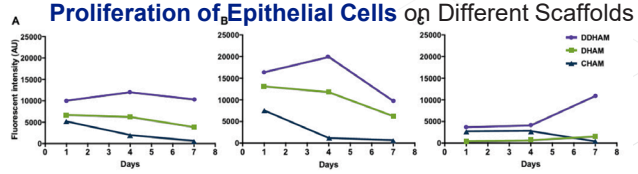
Human corneal epithelial cells and human conjunctival epithelial cells (A), human corneal epithelial cells (B), and human conjunctival epithelial cells (C). The viability of adhered cells was detected using the alamarBlue assay.

Adhesion of Epithelial Cells on Different Scaffolds



Human corneal epithelial cells and human conjunctival epithelial cells were seeded onto scaffolds and incubated for 24H. Adhesion of human corneal epithelial cells and Human conjunctival epithelial cells (A), Human corneal epithelial cells (B), and Human conjunctival epithelial cells (C).

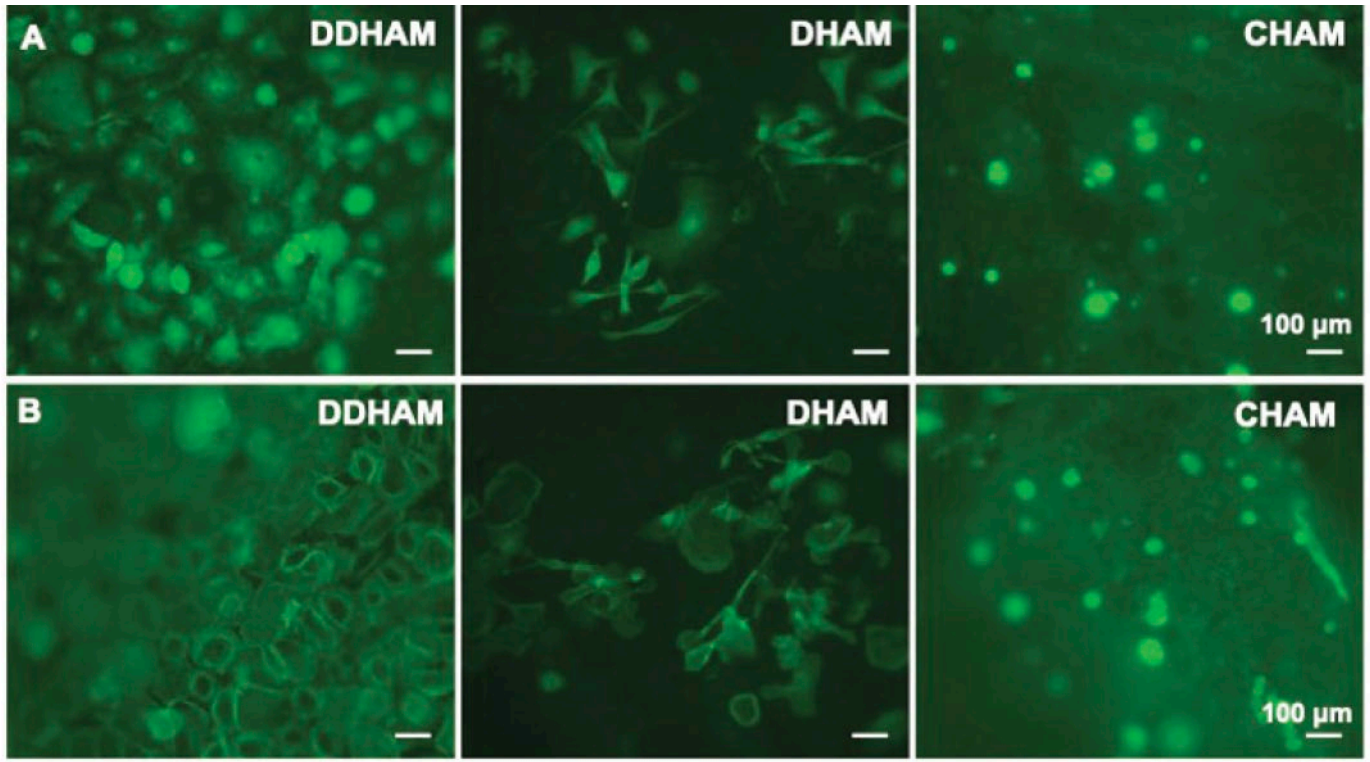
Proliferation of Epithelial Cells on Different Scaffolds



Proliferation of human corneal epithelial cells and human conjunctival epithelial cells (A), human corneal epithelial cells (B), and human conjunctival epithelial cells (C)

1. Diaz V. et al; ARVO 2022 Poster; A Comparison Study of the Effects of Ocular Scaffolds on Human Ocular Epithelial Cells; 2. Rutgers Benchtop Data Report: Biovance 3L Ocular;

BENCHTOP STUDY FINDINGS:
BIOVANCE 3L OCULAR WITH CALCIEN AM STAINING AT DAY 4



Human corneal epithelial cells were seeded on the different scaffolds, cultured, and stained with Calcein AM to visualize viable cells at Day 4 (A).

The morphology of Human corneal epithelial cells on scaffolds was monitored by actin staining on Day 4 (B).

DDHAM (Biovance 3L Ocular) = Decelluarized, Dehydrated human amniotic membrane
ChAM (AmnioGraft) = Cryopreserved human amniotic membrane
DhAM (Ambio2) = Dehydrated human amniotic membrane

BANDAGE CONTACT LENS CONSIDERATIONS

CLINICAL APPLICATION PROCESS

Required materials

Anesthetic drops, sterile gloves, Weck-Cel tip applicator, antibiotic drops, sterile toothless forceps, eyelid speculum (optional)

Clinical application process

- Place unopened tissue, contact lens case, toothless forceps, Weck-Cel or cotton tip applicator and other materials needed on workspace. Keep Biovance 3L Ocular covered until ready for placement.
- If using an eye lid speculum, place it now.
- Instill one drop of topical anesthetic to eye, followed by one non-viscous topical antibiotic drop.
- Use Weck-Cel sponge to dry corneal surface.
- Carefully open pouch.
- Use smooth tip forceps and remove Biovance 3L Ocular from pouch (grooved forceps can damage the product).
- Place graft centrally on to the cornea using toothless forceps and use a damp Weck-Cel to smooth Biovance 3L Ocular to corneal surface.
- Place a drop of antibiotic or preservative-free tears on to the Biovance 3L Ocular graft to hydrate.
- Remove bandage contact lens (BCL) from case and place over the graft*.
- Place a drop of antibiotic or preservative-free tears on to the bandage contact lens.
- Instruct patient to keep eyes closed for 2-3 minutes without rubbing eyes.
- Instruct patient to continue with antibiotic and lubrication eye drops, as directed. Plan to see patient in 5-7 days; sooner if there is discomfort / redness / swelling.

- Access Clinical Application Process Video at www.versea.com/ophthalmics/resources

BANDAGE CONTACT LENS (BCL) PEARLS

Potential Complication

- All BCLs induce some level of edema, including silicone hydrogels, which have extremely high DK/T values
- Underlying dry eye predisposes to contact lens discomfort
- CLs restrict corneal oxygen availability, creating a hypoxic environment at the anterior corneal surface[1]
    - Cornea edema
    - Anterior chamber reaction
    - Sterile mid-peripheral infiltrates

Mitigation Strategy

- Pressure patch in lieu of BCL
- Use keratometry to fit BCL with an AMG flatter than average K value[2]
- Use topical antibiotic/steroid combination or immunomodulator to reduce inflammation produces favorable outcomes in terms of pain management and epithelial healing[3-4]
- Frequent lubrication

Optical Coherence Tomography as a Biomarker for Diagnosis, Progression, and Prognosis of Neurodegenerative Diseases
Satue, etal AJO 2016

- Recent research using the latest SD OCT imaging technology has demonstrated that an early damage of the anterior visual pathway occurs in MS, PD, and AD and that the ganglion cell layer is the ultimate biomarker for disease diagnosis, severity, and progression.
- Thus, OCT technology should be used as a common and very useful clinical complement in the diagnosis and control of neurodegenerative disorders.

Baseline Fourier-Domain Optical Coherence Tomography Structural Risk Factors for Visual Field Progression in the Advanced Imaging for Glaucoma Study

David Huang, MD etal

AIG/ 2016

- A total of 277 eyes of 188 participants were followed up for 3.7 ± 2.1 years.
- VF progression was observed in 83 eyes (30%).
- Several baseline NFL and GCC parameters, but not disc parameters, were found to be significant predictors of progression on univariate Cox regression analysis.
- The most accurate single predictors were the GCC focal loss volume (FLV), followed closely by NFL-FLV. An abnormal GCC-FLV at baseline increased risk of progression by a hazard ratio of 3.1

New Perspectives on Disease Management

- SD-OCT is superior in identifying progression in glaucoma suspects, pre-perimetric glaucoma, mild glaucoma and early moderate disease compared with SAP are superior in identifying progression, after an initial VF to set baseline.
- Average time to identification of statistically significant progression is 2-3 years with SD-OCT and up 6 years with SAP
- Intra-test variability is up to 10x less with OCT(3%) than VF(20%)

New Perspectives on Disease Management

- RNFL “Floor” limits usefulness in late moderate to advanced glaucoma (50-60 microns)
- GCC progression analysis can continue to be useful in late moderate to advanced glaucoma due to density of fibers in the macula and the later involvement of central vision in the disease

Belkin DSLT

- An investigational IOP-lowering modality, direct selective laser trabeculoplasty (DSLT) (BELKIN Laser), is being developed for its potential as a first-line treatment for ocular hypertension (OHT) open-angle glaucoma (OAG) and possibly for angle-closure glaucoma (ACG) that overcomes the limitations of current initial therapeutic options.
- The non-invasive, non-contact procedure is performed with automated laser technology that delivers 100 spots to the trabecular meshwork through the limbus in just 1.2 seconds.
- A proof-of-concept study provided evidence for the efficacy and safety of the transscleral approach to laser beam delivery using a conventional SLT instrument, and studies are under way outside of the United States using the external automatic glaucoma laser device itself

Belkin DSLT

- **Results**: In the trial group (N=16), IOP decrease from an average of 20.21 mmHg before treatment to 15.50 at 6 months.
- The corresponding numbers for the control group (n=16), were 21.14 mmHg and 15.00. There was no statistical difference between the two groups in IOP reduction.
- Complications rate was significantly higher in the control group ($p<0.0001$, OR 6.881, 95% CI 1.676/28.248).
- Anterior chamber inflammation and superficial punctate keratitis rates were significantly higher in the control group and compared to the study group ($p=0.006$).

Marijuana & Glaucoma

TABLE 1. MARIJUANA SIDE EFFECTS*[5,14]

OCULAR	SYSTEMIC
• Conjunctival hyperemia	• Tachycardia
• Decreased lacrimation	• Decreased blood pressure
• Photophobia	• Orthostatic hypotension
• Ptosis	• Euphoria or dysphoria
• Blepharospasm	• Impaired coordination
• Nystagmus	• Difficulty with concentration, problem solving, memory
• Impairment of accommodation	• Decreased testosterone
	• Impaired immunity

**Any route of administration*

Marijuana & Glaucoma Therapy

American Glaucoma Society:

“Although marijuana can lower the intraocular pressure, its side effects and short duration of action, coupled with a lack of evidence that its use alters the course of glaucoma, preclude recommending this drug in any form for the treatment of glaucoma at the present time.”

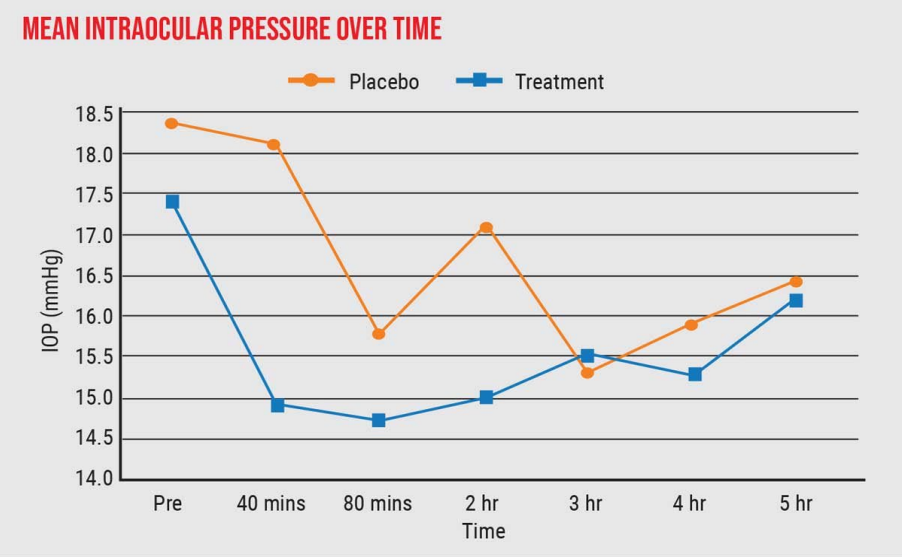
Cannabis, Glaucoma and Intraocular Pressure

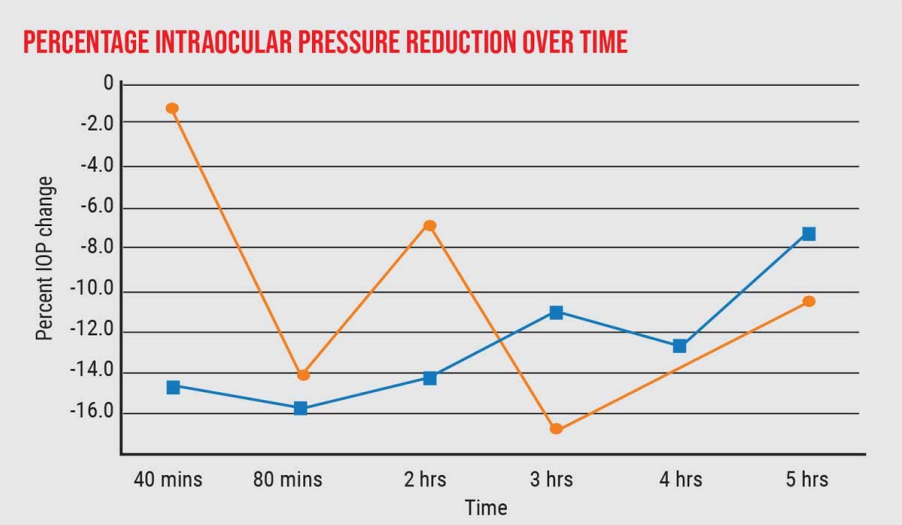
- Because of the Schedule I status and the stigma associated with it, all research on cannabis basically ceased in the 1980s; it was just too difficult to get around the regulations.
- Among other things, limited high-quality data has impacted the current American Academy of Ophthalmology and American Glaucoma Society positions on the use of cannabis to treat glaucoma.
- They don't support it, largely because there's too little information to justify such support.
- Sameh Mosaed, Etal (Review of Ophthalmology 2022)

Cannabis, Glaucoma and Intraocular Pressure

Sameh Mosaed, MD / Review of Ophthalmology

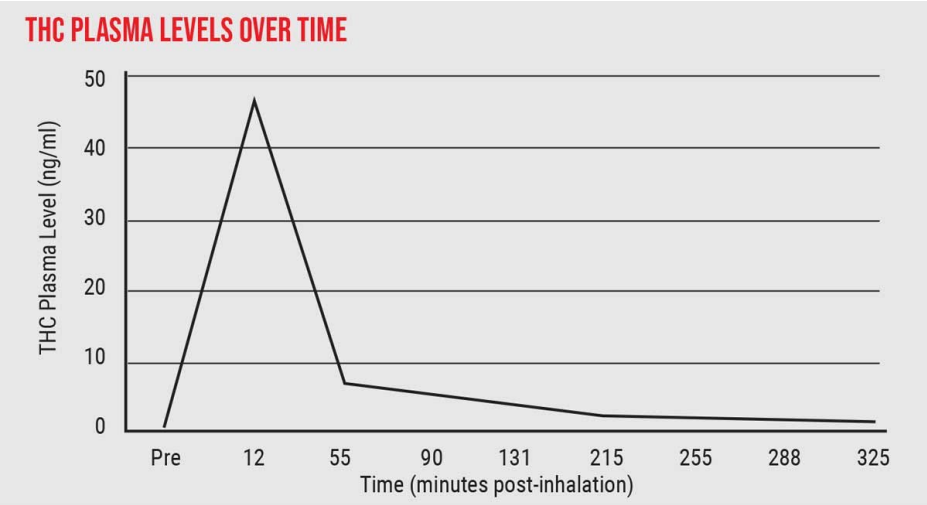
Dr. Mosaed is a professor of ophthalmology and director of the Glaucoma Division of the Gavin Herbert Eye Institute at UC Irvine.
.Dr. Singh is a professor of ophthalmology and chief of the Glaucoma Division at Stanford University School of Medicine.
Dr. Netland is Vernah Scott Moyston Professor and Chair at the University of Virginia in Charlottesville.

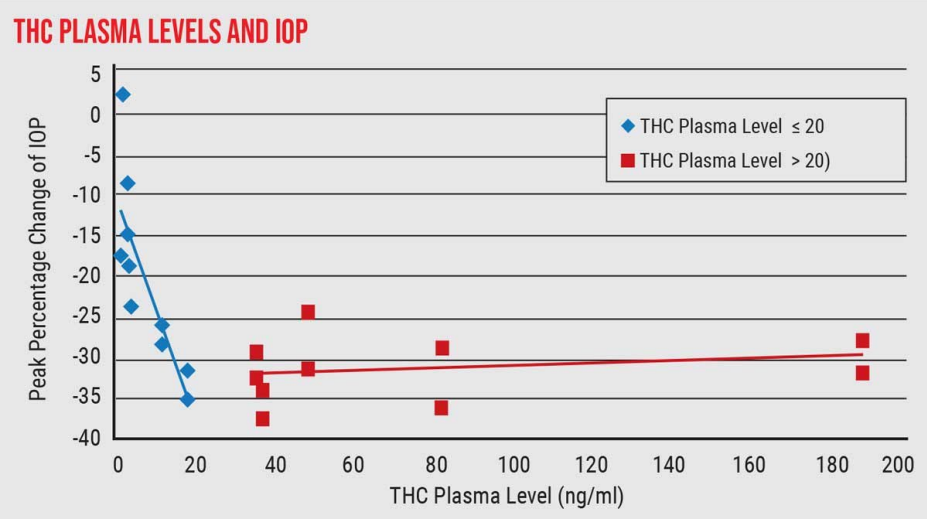




One of the author's studies found a substantial and significant decrease in IOP in subjects smoking cigarettes with THC, compared to placebo. The patients went from a mean IOP of 17.5 mmHg prior to smoking down to lower than 15 mmHg, 15 percent below baseline.

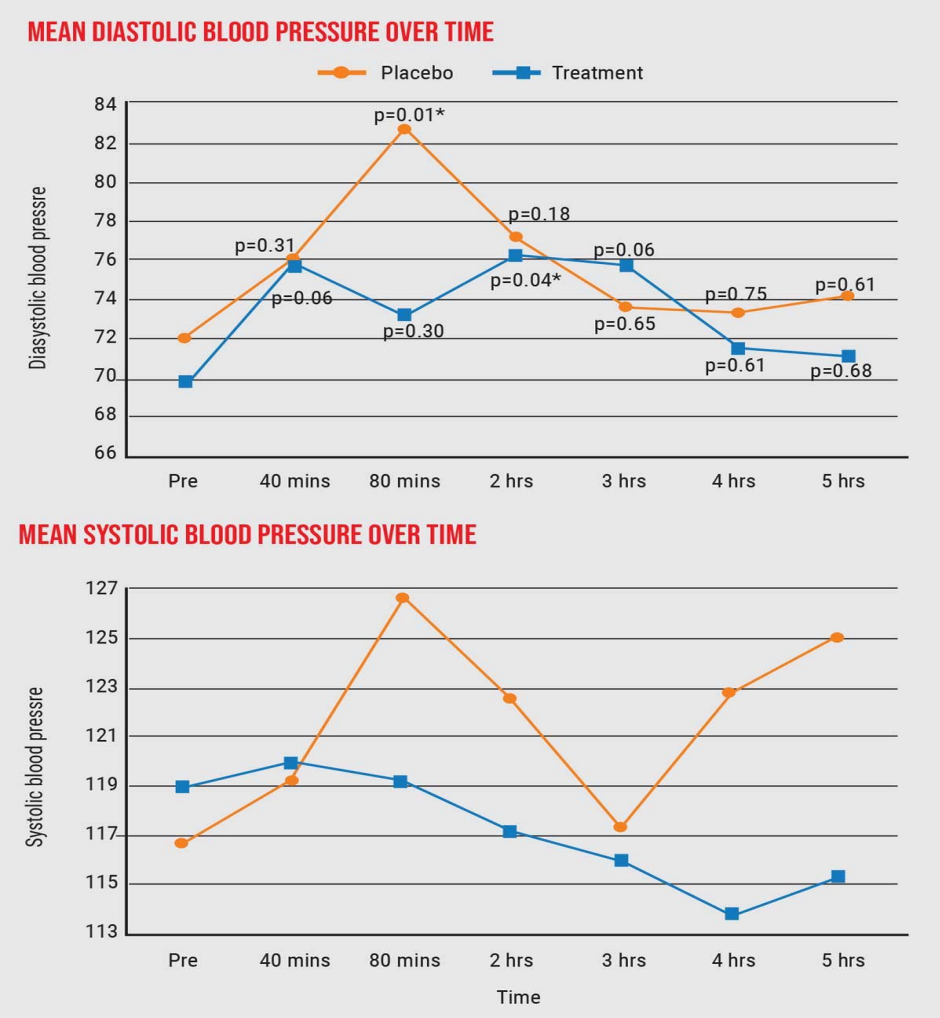
Cannibis, Glaucoma and Intraocular Pressure





THC is metabolized quickly, soon disappearing from the bloodstream. (Top graph) Decline in IOP paralleled rising THC plasma levels up to 20 ng/ml; above that, IOP did not decline. (Bottom graph) This suggests that a limited intake of THC—possibly a small enough amount to avoid psychotropic effects—could accomplish significant IOP lowering

Cannabis, Glaucoma & Intraocular Pressure



The data revealed only one point of statistically significant difference between the placebo group and cannabis group in diastolic or systolic blood pressure (asterisk).

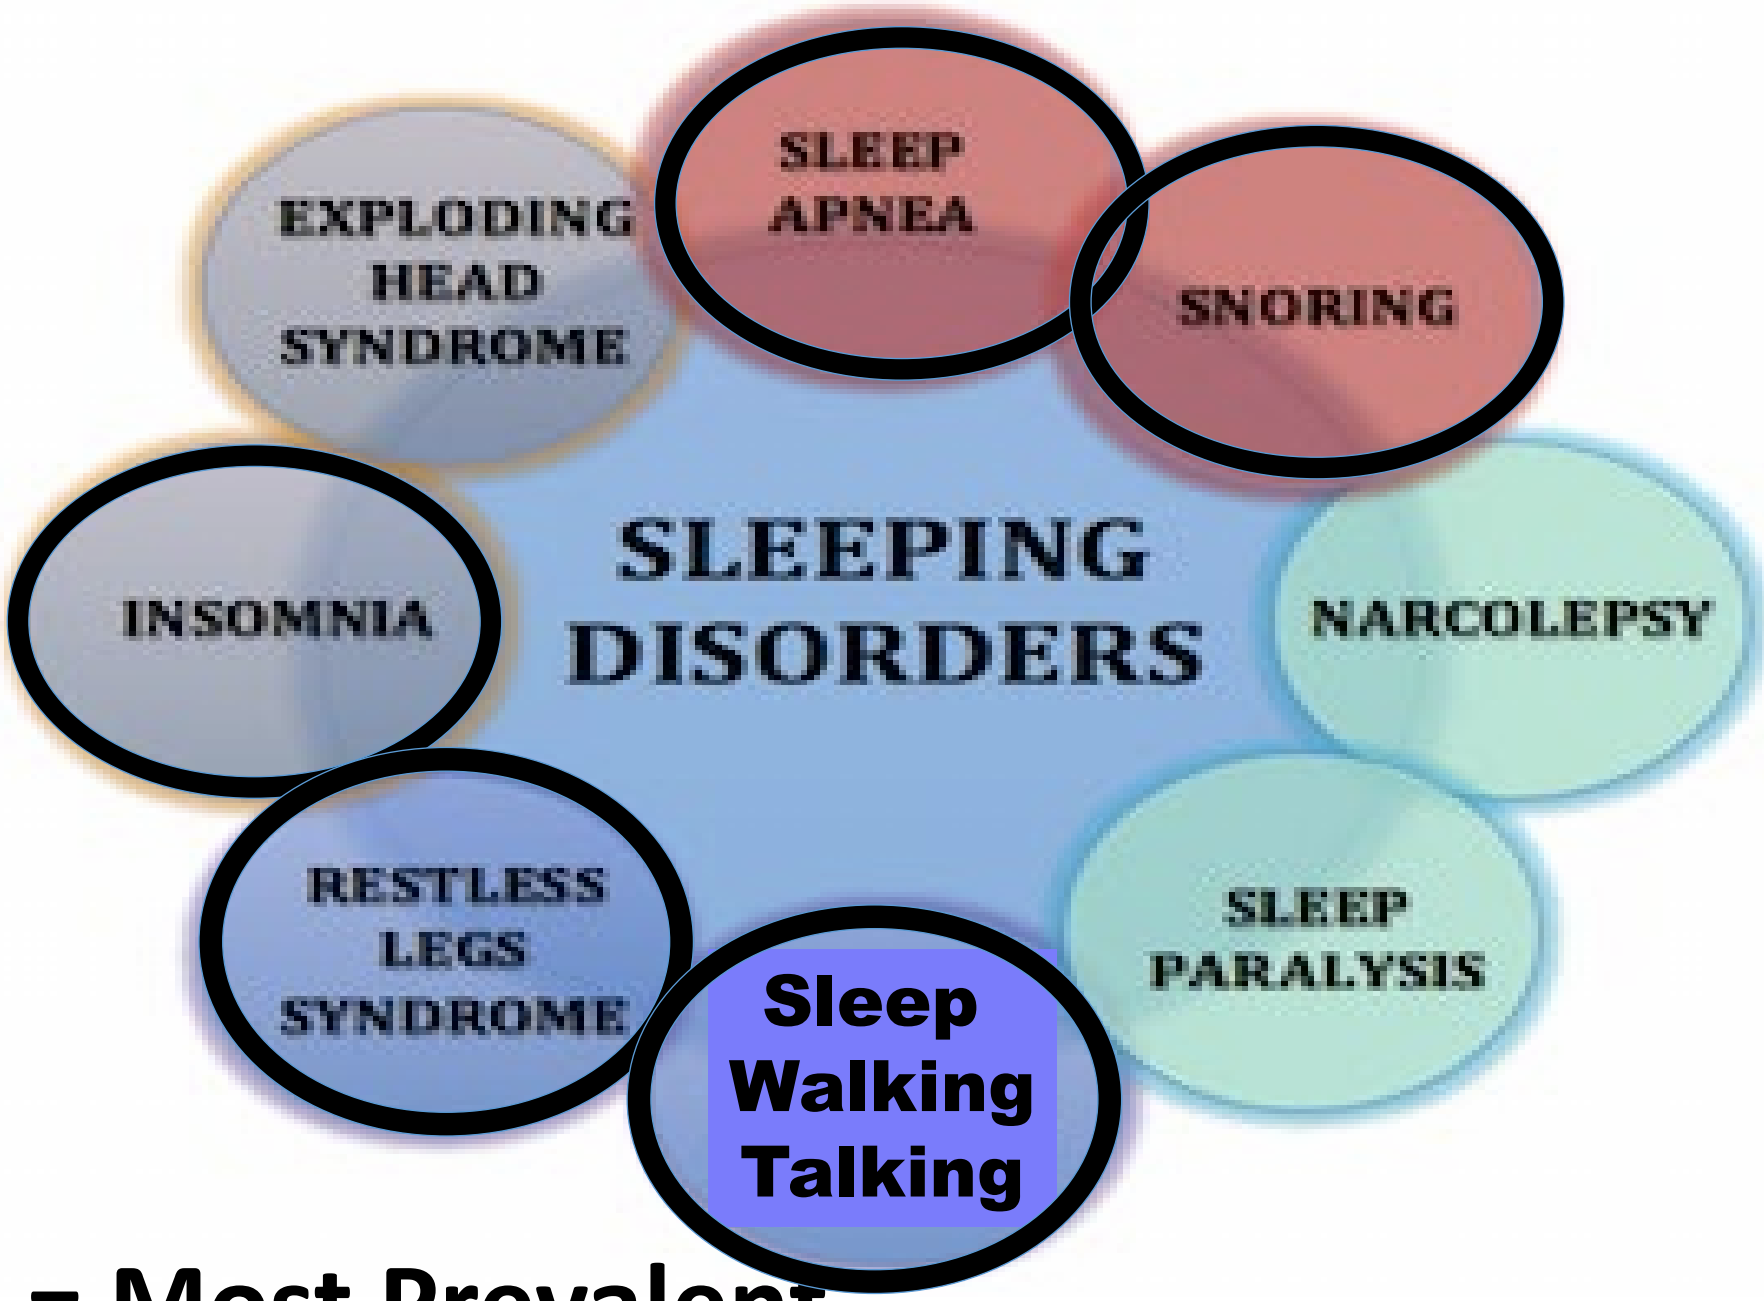
Cannabis, Glaucoma and Intraocular Pressure

- Many people talk about marijuana when they really should be discussing *cannabis*.
- Cannabis is a genus of flowering plants in the *Cannabaceae* family, which consists of three primary species: *Cannabis sativa*; *Cannabis indica*; and *Cannabis ruderalis*.
- The term marijuana has negative connotations; it's used to refer to specific varieties of cannabis that contain more than 0.3 percent THC. CBD, on the other hand, has no psychotropic effects.
- Cannabis contains multiple compounds—more than 480, of which about 65 have been identified as phytocannabinoids (including CBD and THC).
- Cannabis also contains about 120 compounds that give it its characteristic aroma—mainly volatile terpenes and sesquiterpenes. Not surprisingly, most patients don't know much about cannabis; many don't even understand the distinction between THC and CBD.

Cannabis, Glaucoma & Intraocular Pressure

- We found a substantial and significant decrease in IOP in subjects smoking cigarettes with THC compared to placebo. The patients went from an average IOP of 17.5 mmHg prior to smoking, down to lower than 15 mmHg, 15 percent lower than baseline.
- A 15-percent reduction, when you start out with normal pressure, is quite significant—on a par with what you'd see with a single-agent IOP-lowering eye drop.
- The lower pressure was sustained for up to three hours.
- In terms of systolic and diastolic blood pressure, we found no statistically significant differences between the placebo group and cannabis group. There were some differences, as the graphs show *(graph below)*, but the differences were only statistically significant at a single time point (marked with an asterisk).
- We confirmed that THC is metabolized very quickly; it gets absorbed into tissues and disappears from the bloodstream very quickly.
- There was a linear correlation between THC level in the blood plasma and IOP reduction, up to about 20 ng/ml of THC. Additional elevation of plasma THC, however, didn't correlate with further IOP lowering. *(See graph above.)* In other words, achieving 20 ng/ml of blood plasma level of THC was all that was required to achieve the maximum IOP-lowering effect.

Sleep Apnea:
It’s Role in Glaucoma Management



= Most Prevalent

Sleep Apnea

- **Most case are Obstructive (OSAS)**
  - **22% of men / 17% of women → 22 million Americans**
  - **Rates increase with age & obesity →** **80% unDx**
- **< 10% are Central - <1% of population**
  - **Decreased or absent ventilatory effort (neurologic)**

- **Apnea: temporary cessation of breathing (≥ 10 seconds) during sleep with reduced O_2 saturation [≥ 4% drop]**
- **Hypopnea: decreased airflow ≥ 10 sec with reduced O_2 saturation (≥3% or ≥ 4%) (partial obstruction)**
  - **Elevated Apnea-Hypopnea Index (AHI)**

J Thorac Dis. 2015 Aug; 7(8): 1311–1322

Is POAG Prevalence Higher in OSAS?

- 2023 Systematic review and meta-analysis of 46 studies (n= 4+ million patients), OSAS was associated with a 40% increased risk of POAG after adjusments for age, gender, diabetes, HTN, CV disease/dyslipidemia ($p < 0.01$)

Cheong AJY, Wang SKX, Woon CY, Yap KH, Ng KJY, Xu FWX, Alkan U, Ng ACW, See A, Loh SRH, Aung T, Toh ST. Obstructive sleep apnoea and glaucoma: a systematic review and meta-analysis. Eye (Lond). 2023 Oct;37(15):3065-3083.

Higher Prevalence of OSAS in Patients with Dx Glaucoma?

- 2021 meta-analysis of of 10 studies with 966 subjects
- **35% of glaucoma patients had OSAS**
  - → compared to 20% of the adult population

Yu BE, Cheung R, Hutnik C, Malvankar-Mehta MS. Prevalence of Obstructive Sleep Apnea in Glaucoma Patients: A Systematic Review and Meta-analysis. J Curr Glaucoma Pract. 2021 Sep-Dec;15(3):109-116.

Treating OSA

- CPAP is the **gold standard**, but compliance rates are low (50% discontinue within the first year and another 25% by year 3)
- Females, > 55 yo and improved daytime sleepiness (ESS) predict compliance past 6 mos

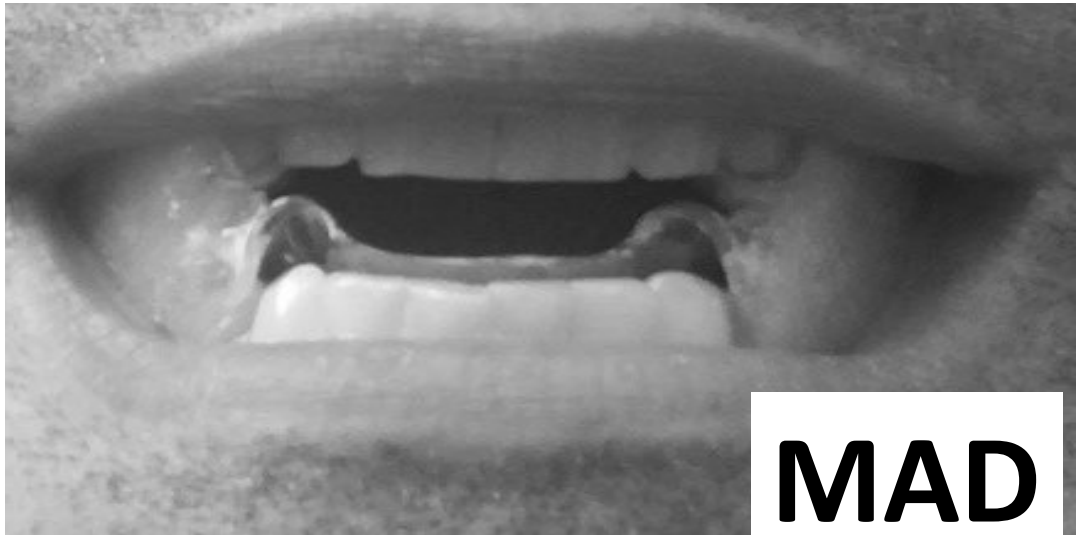
Respir Care. 2010 Sep;55(9):1230-9

- CPAP did NOT improve MACE or mortality in pts with established CVD (mean nightly use only 3.3 hrs on 70% of nights)

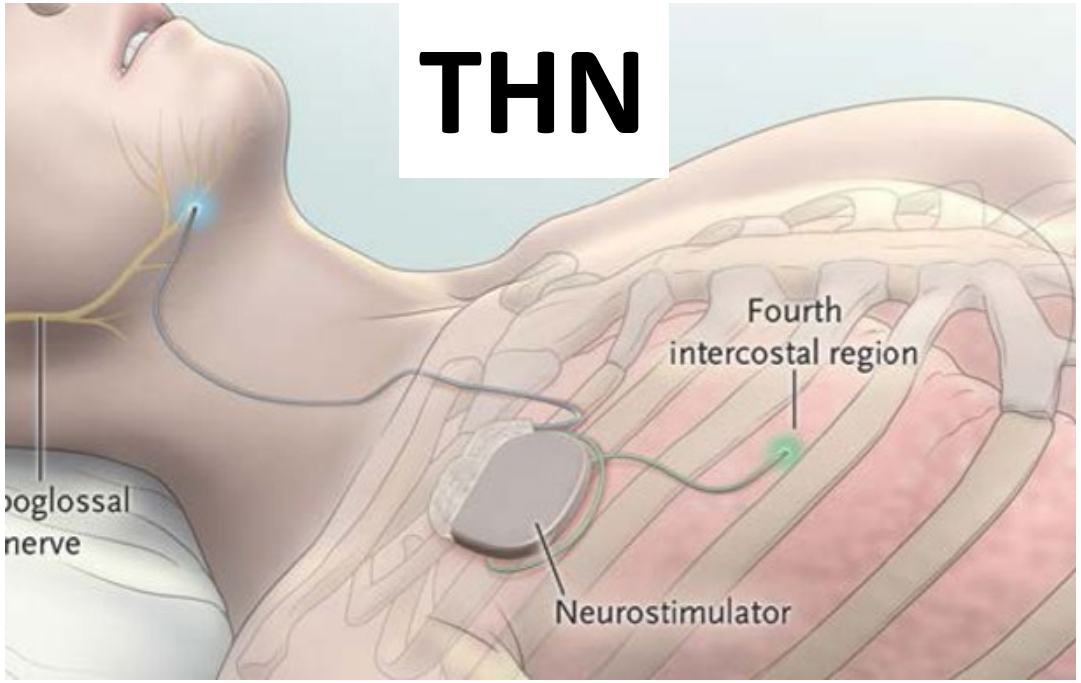
Sleep Apnea. N Engl J Med. 2016 Sep 8;375(10):919-31

Other OSA Tx Options NOT ↑ EVP

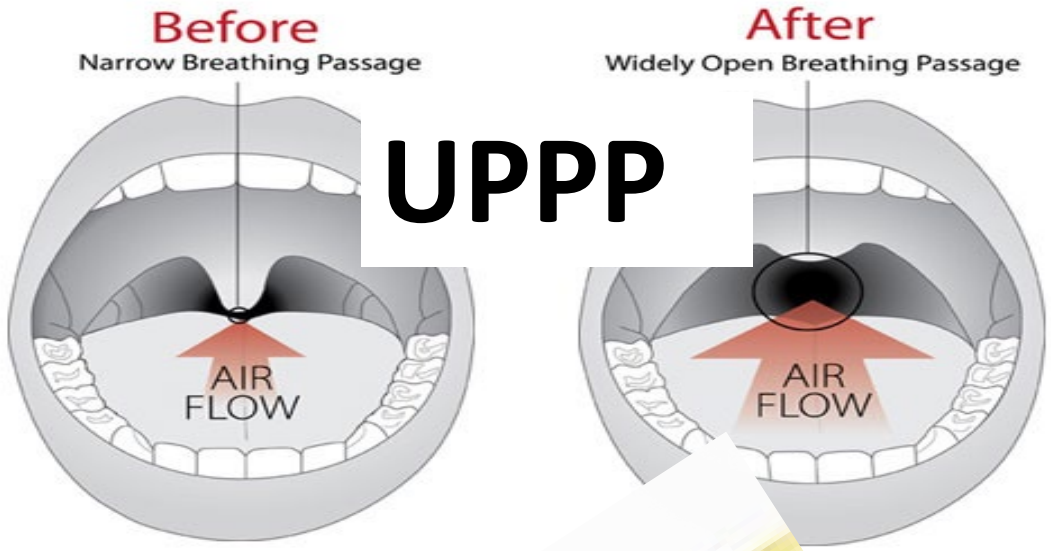
- **Mandibular Advancement Devices (MAD)**
  - comparable to CPAP for mild OSA (50-60% lower AHI)
- **Uvulopalatopharyngoplasty (UPPP)**
  - removal of tonsils, posterior soft palate, uvula
- **Targeted Hypoglossal Neurostimulation**
  - improves tongue muscle tonus
- **Playing a double-reed instrument (e.g. an oboe)**
  - lower prevalence of OSA
- **Play didgeridoo - comparable to CPAP for mild-moderate OSA**
- **Weight Loss**



MAD



THN



UPPP

Targeted Hypoglossal Neurostimulation

- **Minimally invasive surgery**
- **Intercostal pacemaker with a multi-contact electrode to CN XII**
  - **43% with significant improvement in AHI & O_2 saturation at 6 mos**
  - **BMI < 35 and AHI < 65 predicted good response**
  - **At 1 year, 'responders' had mean AHI decrease from 28.6 to 9.5 events/hour**
  - **> 50% reduction in AHI at 5 years**

Laryngoscope. 2016 Nov;126(11):2618-2623
Laryngoscope. 2018 Feb;128(2):509-515
Otolaryngol Head Neck Surg. 2018 Jul;159(1):194-202

Mandibular Advancement Devices (MAD)

- Reduce required positive airway pressure when used in combination with CPAP
- Combo Tx better tolerated by many patients
- **Patients without severe upper airway collapsibility and with a weaker reflex of throat muscles were more likely to benefit from MAD** (measured by PSG)
  - 93 adults with moderate to severe OSA
  - **OSAS severity & BMI did NOT predict response to MAD**
